composing the potato leaf. Branches from this, as at *a a a*, grow through the epidermis, or pass through the stomata into the air, and there become branched. The ends of the branches develop spores of two kinds. One kind (*b b b b b b*) are called *conidia*, because they are so

minute and dust-like. As soon as one of these is detached from the branch producing it, another is formed in its place, and so a very abundant crop of these conidia is produced, each one of which is capable of reproducing the fungus if it falls upon, or is carried by the wind to, a place that is favourable for its growth. The second kind are the *zoospores*. These are formed in an egg-shaped cell terminating a branch (*c*), termed a *swarm-spore*. When wetted by dew or rain, the swarm-spore bursts and the zoo-spores are set free (*d*). These move about by means of the two little tails with which they are furnished, and often pass through the stomata into the interior of the leaf, and there germinate and reproduce the fungus. These two kinds of spores are produced in countless myriads during the brief vege-

tating period of the fungus, but with the decay of the plant these die, and for the preservation of the species during the winter months another kind of spore is formed. The mycelium in the interior of the leaf, stem, and tuber develops, at the ends of short branches, spherical bodies of two sizes, as shown at *e*. The smaller of these is the *antheridium*, and the larger the *ogonium*. The antheridium applies itself to the oogonium, which it pierces with a small tube that it protrudes, and the contents of the two bodies blend; this constitutes fertilization. The fertilized oogonium increases in size, and various internal and external changes take place, until it finally becomes matured into the *resting spore*, shown at *B*, with a thick warted outer wall; in this state it passes the autumn, winter, and spring months, being again called to life by the summer rains. The contents of some of the resting spores break up into the zoospores, (*C*), which, when set free, develop two tails, or cilia (*D*), by the vibration of which they move about in any moist medium. After a short time they come to rest, the tails fall into dust, and they germinate and produce mycelium, as at *E*. Other resting spores do not break up into zoospores, but at once develop a mycelial thread, as at *F*, which is much stouter than is produced by the zoospores, and it is most probable that there is a sexual relationship existing between them; for if the mycelium of each kind could be traced, it would probably be found that the slender threads, which produce the antheridia, are those developed from the zoospores of the resting spore, whilst the stouter threads, which produce the oogonia, are those directly produced from the resting spore. The figures *B* to *F* in our engraving are much more highly magnified than is Fig. *A*; *f* is a hair arising from the upper surface of the leaf.

The mycelium developed from the resting spores, whether these break up into zoospores or not, on coming in contact with a potato plant, penetrates and corrodes its tissues, passing up the stem, branching as it grows, and finally pushes branches through the tissues into the air, and there completes the cycle by producing conidia and zoospores, by which the disease is rapidly spread; for these are produced in myriads, and as they germinate under favourable conditions in about an hour, a large area may soon become affected with the disease, from the proximity of a single diseased Potato plant.

The *Peronospora* also attacks the Tomato, proving equally destructive to it as to the Potato.

Although the Potato disease has been such a terrible plague for so many years, there is no known remedy that seems to be of much avail against its ravages. If the season is a tolerably dry one and the tubers are well formed, the crop may be saved by pulling up the haulm before the heavy summer rains come. If the crop once becomes diseased, nothing is likely to stop the disease entirely, because the mycelium grows so rapidly, that although by the application of some remedy it may be killed where the disease seems worst, there is almost certain to be some distant branch of the mycelium that is not killed by the remedy applied, and which will continue the disease.

From what we know of the life-history of *Peronospora*, it appears that it does not exist in a vegetating condition during the winter, but only in the form of resting spores, for the mycelium, aerial zoospores, and conidia are said to perish annually. From these facts two things become very evident: first, that it is hopeless to attempt to exterminate the fungus when it is vegetating and producing conidia and zoospores; for these are produced in such abundance that the air may be said to swarm with them in the neighbourhood of infested Potato plants, and will very rapidly reproduce the fungus and spread the disease. Secondly, that the attack upon the fungus should be made when it is in the resting state, during late autumn and winter. The first step to take is to burn all the Potato haulm as soon as the crop is lifted, so that any resting spores that may be contained in the stems or leaves may be destroyed; for if they are thrown into a heap and allowed to rot, the resting spores will be preserved, and will, the next season, propagate the disease. The next thing is to endeavour to destroy the resting spores that are contained in the earth: if this could be successfully accomplished, the next year's Potato crop would be certain to be pretty free from the disease, unless it were in close proximity with an infected Potato patch, from which the disease could spread. How the resting spores may best be destroyed in the earth, is a question we are unable to answer, for it is here that practical experiments are greatly needed, as hitherto experiments have been confined to the discovery of remedies against the fungus when in a vegetating condition, and these remedies have all failed,

because, as shown above, they do not attack the root of the disease. What is required is something with which the ground can be watered after the crop is lifted, that is cheap enough to be used in large quantities, potent enough to penetrate deep into the soil and to kill the resting spores, and yet it must be quite harmless to the Potato when planted; that is, it should lose its power to hurt vegetation after the lapse of a month or so. It is in this direction that experimentalists should turn their attention. As a remedy of this kind, to be applied when the ground is clear of crops, we would suggest a trial of a dilute solution of sulphuric acid and water.

Fusisporium Sola'ni, of which we here give a magnified representation, is nearly as destructive to the Potato as the *Peronospora*, which it often accompanies. The slender mycelial threads of this fungus ramify through the tissues of the Potato, producing in places aerial fusiform bodies consisting of four cells (spores), one or more of which, in some

cases, germinates and produces a mycelial thread whilst attached to the thread from which it was developed. In other cases the cells become gradually rounded off, as shown at *a*, and separate from each other, forming the resting spores. These remain dormant for a few months, and then, under favourable conditions, they germinate and reproduce the fungus. Whatever remedy is found to answer with the *Peronospora* will also prevail against the *Fusisporium*.

Potato, or Under-ground Onion. (*Allium aggregatum*.) Produces a cluster of bulbs or offsets, in number from two to twelve, and even more, uniformly beneath the surface of the soil. From being first introduced to public notice in Scotland by Captain Burns, of Edinburgh, it is there also known as the *Burn Onion*.

Varieties.—There evidently appear to be two varieties of this vegetable, one of which bears bulbs on the summit of its stems, like the Tree Onion, and the other never throwing up flower-stems at all. One variety is much larger than the other, and this vegetates again as soon as ripe.

Both varieties are best propagated by offsets of the root of moderate size, for if those are employed which the one variety produces on the summit of its stems, they seldom do more than increase in size the first year, but are prolific the next; this also occurs if very small offsets of the root are employed.

Planting.—They may be planted during October or November, or as early in the spring as the season will allow, but not later than April. In the west of England, assisted by their genial climate, they plant on the shortest, and take up on the longest day. They are either to be inserted in drills, or by a blunt dibble, eight inches apart each way, not buried entirely, but the top of the offset just level with the surface. Mr. Maher, gardener at Arundel Castle, merely places the sets on the surface, covering them with leaf-mould, rotten dung, or other light compost. The beds they are grown in are better not made more than four feet wide, for the convenience of cultivation.

The practice of earthing over them, when the stems have grown up, is unnatural; and by so doing the bulbs are blanched, and prevented ripening perfectly, on which their keeping so much depends. So far from following this plan, Mr. Wedgewood, of Betley, recommends the earth always to be cleared away down to the ring from whence the fibres spring, as soon as the leaves have attained their full size, and begin to be brown at the top, so that a kind of basin is formed round the bulb. As soon as they vegetate, they intimate the number of offsets that will be produced by showing a shoot for each.

They attain their full growth towards the end of July, and become completely ripe early in September; for immediate use, they may be taken up as they ripen, but for keeping, a little before they attain perfect maturity.

Potato, Sweet or Spanish. *Batatas edulis.*

Potentilla. Cinquefoil. (From *potens*, powerful; the supposed medicinal quality. Nat. ord., *Rosaceæ*; Tribe, *Potentilleæ*.)

Hardy herbaceous perennials. *Candicans* and

lineariloba require protection in the winter; seeds and division of the plant in spring; shrubs, by cuttings of ripe wood in the autumn, or by cuttings in summer, under a hand-light; good, deep, sandy loam. All yellow-flowered, except where otherwise mentioned.

P. nudicaulis. Gfl. t. 1096. A synonym of *Æchmea nudicaulis*.

Pot-Marigold. *Calendula officinalis*.

Potting. In performing this operation the *Pots* are the first consideration, and for information relative to these, see **Flower-pots**.

Time of Potting.—This, when necessary, should generally be done after pruning, and when fresh growth has taken place. The reason for this is, that it is advisable never to give more checks to a plant at once than cannot be avoided. The cutting down is a check, the repotting or shifting is another. Therefore, in both cases, we apply an extra stimulus for a short time immediately after, by keeping the plants closer and warmer.

State of the Soil.—It should neither be dry nor wet. If very dry, it will not pack so well in the pot; the water, if it passes freely at all, will find chinks and crannies for itself, and it will be long before the general mass becomes sufficiently moist to support a healthy vegetation. On the other hand, if wet soil is used, it is apt to pack too close; frequent waterings are apt to puddle it; the very closeness, even

when the drainage is all right, prevents the air from penetrating. To know the proper dryness, take a handful; if by tightly squeezing it just holds together slightly, it will do; if it forms a compact mass, so that it might be laid on the potting-board without any risk of tumbling to pieces, it is too wet. It is not necessary that the whole of the material should be in a uniform state of moisture; for instance, we want some rough stuff to place over the drainage, that may be drier. The soil is rather fine; and to improve its mechanical texture we insert little nodules of fibry loam or peat, little or big, in proportion to the size of the pot, and the smallness and largeness of the shift given. These nodules, if not too numerous, may be *drier*. So in the case of a manure, which we may wish to act both as a mechanical agent, and to give out its nourishment not at once, but for a long period. It should be old; but it should be *hard* and *dried*. When rapid action from manure is required, it should be finely divided, and regularly mixed with the soil, or used largely as a mulching or top-dressing.

The Soil should be rough and open.— Exceptions there are, such as a covering for small seeds, which must be fine; in fact, if just pressed into the appropriate soil, a dusting of silver-sand scattered over, and then a square of glass put over the pot, it will answer better than the finest-sifted soil. We would not use a sieve at all, unless a very fine one to get rid of the more dusty portion; and this should always be done before adding sand as a lightening agent. The rule to follow, for general purposes, is to use rough and lumpy, fibry soil, in opposition to that which is fine and sifted; but let that roughness consist in numbers of small rather than a few of larger pieces, and when the latter are used, let them be in proportion to the size of the pot, and the size of the shift given. For instance, for a 4-inch pot, the largest pieces may range from the size of peas to horse-beans; for an 8-inch pot, the largest pieces may be like walnuts, but not many of that size; and for a 16-inch pot, a few pieces may be as large as eggs, with every other size downwards, and well packed with the finer soil from which the mere dust has been extracted.

Securing and Preparing suitable Soil.—*Heath-soil*, so necessary for hair-like rooted plants, can only be procured from upland commons where the heath naturally grows. *Loam* of almost every quality can be procured by taking the surface

turf from pasture and the sides of roads, and building it in narrow ridges when dry, and using it after being so built up for six or twelve months. Failing these sources, for all plants not requiring peat earth, suitable soil may be obtained from the sides of highways, and by skimming off the flaky material from the tops of ridges that have been trenched up for some time in the kitchen-garden. In using the latter, however, you must, in general, be content with small shifts, as you will not be able to get the soil rough enough for large ones. The plants, notwithstanding, will thrive beautifully, and size for size will often yield more bloom than if you had used large shifts and larger pots. If the latter is your wish, you may use pieces of charcoal, or, what will answer extremely well, get a few fibry sods taken off quite thin, dry them over a furnace, or, what is better, char the grassy sides by putting them on an old spade or other iron, and then place them over a fire; allow the sods to be exposed for a few days to sweeten; and then, if broken into small pieces, they will not only be useful for placing over the drainage, but also for mixing with *any*, but chiefly *fine* soil to keep it open. Where rough soil is wanted for large shifts, it is best to pile the turf, when dry, in narrow stacks, through which the air may circulate, and yet the wet be excluded. In using such a heap, after the time specified, there is little occasion to turn it frequently afterwards, which would be necessary in the case of other fresh soil not so exposed; for we must not forget that every turning we give, while it renders the soil more aerated and sweet, renders it also more fine and *dense*, from the decomposition of its fibre. *Charcoal*, owing to its lightness, not to speak of its chemical properties, is the best assistant for rendering the soil porous; and enough of this may be got from every garden by charring the rubbish. Failing that, however, broken brick, broken pots, and lime-rubbish may be used with advantage, if there is nothing in the peculiar plant to render one or all unsuitable.

Drainage.—A plant badly drained will never show fine cultivation. Where worms are likely to intrude, the convex side of the potsherd should be placed over the hole; but for amateurs, nothing is better than small caps of tin or zinc to cover over the hole completely; and in either case, plenty of drainage placed over them, the materials being smaller as it ascends. For anything requiring nicety, there ought to be at least one-inch drainage in a five-inch pot,

and so in proportion. The best covering for the drainage is a sprinkling of green moss, to separate the drainage from the soil; over that some of the rougher materials should be placed, and then some of the finer, on which the base of the ball should rest.

Potting or Shifting.—The pots should be new or thoroughly clean. No man deserves to have a nice plant who would place it in a dirty pot, and rarely will he be rewarded with one. When he attempts to shift again, it serves him right to find that roots and soil alike are so sticking to the sides of the pot, that he must break the pot, or lacerate the roots. Before commencing operations, see that the ball of the plant is moist from the centre to the circumference. If not, you can never moisten it afterwards without labour, which may as well be spared. 2. If you wish to rattle your plants on until a certain period, upon the successive shift system, never allow the roots to mat round the sides of the pot; but reshift as soon as they get there. 3. If the roots should be a little matted, gently disentangle them, even though in doing so you get rid of a good quantity of the old soil, and spread these roots out into layers, packing them as you proceed with soil of various degrees of fineness. 4. The soil in general should be as high in temperature, or nearly so, as the plant enjoyed previously. Cold soil has injured many a fine plant. We have said nothing of cutting roots, because that chiefly applies to particular times and instances. Generally, when after a period of rest, fresh growth is to be induced.

Immediate after-treatment.—Whatever system of potting has been adopted, a greater excitement to growth than usual should be given. If well watered previously to potting, and a largish shift given, little water will be wanted at the root for a time; but that should be several degrees warmer than usual; and frequent irrigations in bright weather should be imparted, accompanied with shading, if necessary. 1. A small shift was given, water will be wanted more freely at the root; and here, as well as in the other case, a higher temperature should for a time be maintained, until fresh growth has freely commenced, when air and exposure may be more freely given. See **One-shift System**.

Potting-off is the term applied to moving into pots, singly, seedlings or cuttings from where they have been grown numerously together.

Pottle. See **Basket**.

Poupa'rdia. (Called *Bois de Pourpart*, in the Isle of Bourbon. Nat. ord., *Anacardiaceæ*.) See **Spondias**.

Stove evergreen trees. Cuttings of ripe shoots in sand, under a bell-glass; peat and loam. Winter temp., 55° to 60°; summer, 60° to 85°.

P. borbonica. See *Spondias borbonica*.

—*du'lcis.* See *Spondias dulcis*.

—*ere'cta.* 1. Blue. June. Australia. 1819.

—*repens.* White, violet. Summer and autumn.

Falkland Islands. Syns., *Lobelia Pratiana*, and *L. repens*.

Pre'mna. (From *premnon*, the stump of a tree; referring to the habit of these plants. Nat. ord., *Verbena-ceæ*.)

Stove shrubs or trees. Sandy loam, peat and leaf-mould. Seeds or cuttings.

P. esculenta. 8. Yellowish-white. May. East Indies. 1824.

—*integrifolia.* 10. Greenish-white. July. East Indies. 1827. Syns., *P. serratifolia* and *P. spinosa*. Headache Tree.

P. latifolia. 15. White. June. East Indies.

1827.
— *serratifolia*. } See *P. integrifolia*.
— *spinosa* }

Prenanthes. (From *prenes*, drooping, and *anthos*, a flower. Nat. ord., *Compositæ*; Tribe, *Cichoraceæ*.)

P. arborescens and *pinna* are greenhouse shrubs, the rest tall, hardy herbs. Common treatment. See GREENHOUSE.

P. alba. 4. White. Autumn. North America. 1762. B. M. t. 1079.

— *arborescens*. Canary Islands.

— *pinna*. Canary Islands.

— *purpurea*. 4. Purple. August. Central Europe. 1658.

— *virgata*. 4. Lilac. August. North America. 1823.

Preptanthe. (From *preptos*, distinguished, and *anthos*, a flower. Nat. ord., *Orchideæ*; Tribe, *Epidendraceæ-Cœlogyneæ*.) A synonym of **Callanthe**.

Prepussa. (From *prepousa*, comely; the beauty of the flowers. Nat. ord., *Gentianeæ*; Tribe, *Chironiaceæ*. Allied to *Lisianthus*.)

Stove herbaceous perennials. Seeds in a hot-bed, in spring; division of the plant at the same time. Winter temp., 48° to 55°; summer, 60° to 80°.

P. Hookeri. 1. White, crimson. March. Brazil. 1839. B. M. t. 3909.

Prescottia. (Named after John Prescott, a botanist of St. Petersburg. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Spirantheæ*. Allied to *Spiranthes*.)

Stove terrestrial orchid. For cultivation, see ORCHIDS.

P. colorans. 2. Green. Brazil. 1834. B. R. t. 1915.

— *densiflora*. 3. White. Brazil. 1866.

— *plantaginæa*. Greenish-white. Brazil. 1822. B. C. t. 990.

Preslia. (In honour of C. B. and J. S. Presl, of Prague, botanical authors. Nat. ord., *Labiataæ*; Tribe, *Satureineæ*. Allied to *Mentha*.)

Hardy, perennial herb. Ordinary soil. Divisions.

P. cervina. Prostrate. Pale purple. June. Mediterranean region. 1684. Syn., *Mentha punctata*.

Prestoea. (After H. Prestoe, once Director of the Trinidad Botanic Gardens. Nat. ord., *Palmeæ*.)

Dwarf stove palms. For culture, see PHENIX.

P. Carderi. Columbia. 1876. B. M. t. 7108.

Syn., *Geonoma Carderi*.

— *montana*. Tropical America. Syn., *Euterpe montana*.

— *pubigera*. 12. West Indies. Syn., *Hypspathe pubigera*.

Prestonia. (Named after C. Preston, M. D. Nat. ord., *Apocynaceæ*; Tribe, *Echitideæ*. Allied to *Wrightia*.)

Stove evergreen, white-flowered twiners, from South America. Cuttings of half-ripened, stubby side-shoots in sand, under a bell-glass, in heat;

sandy loam, and a little fibry peat or dried leaf-mould. Winter temp., 48° to 58°; summer, 60° to 85°.

P. glabra. 8. July. Quito. 1823.

— *hirsuta*. 10. Yellow, rose. September. Brazil. 1843. Syns., *Echites hirsuta* and *E. hirtella*.

— *tomentosa*. 8. July. Brazil. 1820.

— *venosa*. Yellowish-green. June. St. Vincent. 1821. Syns., *Echites nutans*, B. M. t. 2473, *Hæmadictyon nutans*, and *H. venosum*.

Pricking-out is transplanting seedlings from their seed-bed more thinly, that they may acquire more fibrous roots and strength previously to their being finally planted out.

Prickly Cedar. *Cyathodes oxycedrus*.

Prickly Pear. *Opuntia*.

Prickwood or Timber. *Eucalyptus europæus* and *Cornus sanguinea*.

Priestleya. (Named after Dr. Priestley. Nat. ord., *Leguminosæ*; Tribe, *Gesticeæ*. Allied to *Liparia*.)

Greenhouse, yellow-flowered, evergreen shrubs, from South Africa, all about three feet high. Cuttings of half-ripened short shoots in sand, under a bell-glass; sandy loam and fibry peat, and thoroughly well-drained, to assist which charcoal and pieces of broken brick or sand-stone may be mixed with the compost. Winter temp., 40° to 48°. Such species as *vestita* should be tried against a wall.

P. axillaris. June. 1822.

— *capitata*. July. 1812.

— *elliptica*. 1825.

— *ericaefolia*. A synonym of *Amphithalia ericaefolia*.

— *graminifolia*. June. 1800.

— *hirsuta*. August. 1792.

— *lævigata*. July. 1820.

— *myrtifolia*. June. 1823.

— *sericea*. June. 1794.

— *teres*. June. 1816.

— *tomentosa*. July. 1812.

— *umbellifera*. July. 1826.

— *vestita*. May. 1800. Syns., *Liparia vestita*, B. M. t. 2223 and *L. villosa*, Andr. Rep. t. 382.

— *villosa*. June. 1774.

Primula. Primrose. (From *primus*, the first; early flowering. Nat. ord., *Primulaceæ*; Tribe, *Primuleæ*.)

Seeds in April, in light, sandy border; divisions of the plant in March and April, or when the plants have done flowering, or in the autumn. *Prænitens*, or *sineensis*, and its varieties, by seed in a slight hotbed, in spring or the beginning of autumn, according as the plants are wanted to bloom early in winter or the following spring. The Chinese double varieties (so useful for nosegays in winter), by cuttings after flowering, in April or May, and by re-potting the small plants of last year; sandy loam and peat, enriched with a little decayed cow-dung, and kept open with small nodules of charcoal. These should seldom be below 40° in winter, and the nearer they range from 45° at night, and 50° and 55° during the day, the better they will bloom. A history of the Chinese Primulas will be found in the "Journal of the Royal Horticultural Society," 1891, p. 99.

- P. acapulcensis*. See *P. vulgaris*.
 — *flöre ple'no*. A synonym of *P. vulgaris*, var. *flöre pleno*.
 — *ibérica*. Lilac-rose. Spring. 1885.
 — *admonte'nsis*. Lilac. May. Styrian Alps. 1883. A hybrid. Syns., *P. Churchillii* and *P. Chusiana*, var. *dentata*.
 — *a'lgida*. Purplish. Spring. Siberia.
 — *cuspidens*. Purple. Songaria. 1875.
 — *Allio'ni*. Mauve, white. April. South France.

Primu'la. (From its resemblance to *Primula*. Nat. ord., *Gesneraceæ*.)

Half-hardy perennial, alpine plant with the habit of a *Primula* and odour of tobacco. In China it is known as Shek-in or Rock Tobacco.

P. Tabacum. †. Violet-purple. China. 1889. G. C. 1889, vi. p. 356, fig. 52. Syn., *P. sinensis*, B. M. t. 7117.

Pri'nos. Winter Berry. (The ancient name of the Holly, which some of the species resemble. Nat. ord., *Ilicineæ*.) See *Ilex*.

All hardy and deciduous, except *hu'cidus* (which is a hardy evergreen), and *montanus*, which is a stove-evergreen. All white-flowered. Hardy kinds, seeds and layers; stove kinds, by cuttings of firm shoots in sand, under a bell-glass; sandy loam and peat.

Prio'nium. (From *prionion*, a small saw; alluding to the serrated leaves. Nat. ord., *Juncaceæ*; Tribe, *Eryunjeæ*.)

This remarkable rush is found in S. Africa, not only in swampy places, but on the banks of rivers, which it helps to choke up. Very strong fibres, suitable for brushmaking, are obtained from the old leaf-stalks.

P. Palmi'ta. 6. Brownish. S. Africa. 1857. B. M. t. 5722.

Prismatocarpus. (From *prisma*, *prismata*, a prism, and *karpus*, fruit; the fruits are long and angular. Nat. ord., *Campanulaceæ*; Tribe, *Campanuleæ*.)

Greenhouse perennial herbs. For culture, see *CAMPANULA*.

- P. falca'tus*. See *Specularia falcata*.
- *hirsu'tus*. See *Specularia Speculum*, var. *pubescens*.

- *perfolia'tus*. See *Specularia perfoliata*.

Pritchardia. (In honour of *W. T.*

Pritchard, the author of "Polynesian Reminiscences." Nat. ord., *Palmææ*; Tribe, *Coryphecæ*.)

Very ornamental stove palms with large fan-shaped leaves. Sandy loam, peat, and rotten leaves. Seeds. Summer temp., 80° to 90°; winter, 65° to 70°.

Pri'ya. (Derivation not stated. Nat. ord., *Verbenacæ*; Tribe, *Verbenacæ*.)

Greenhouse herb. Compost of sandy loam and leaf-mould. Seeds.

- P. lævis*. 1½. Rosy-lilac. Summer. Chili and Argentine Republic. 1883. Gf. t. 1131.

Privet. *Ligustrum vulgare*.

Privet, Mock. *Phillyrea*.

Pro'ckia. (Probably a commemorative name. Nat. ord., *Tiliacæ*; Tribe, *Prockiacæ*.)

Stove, yellow-flowered, evergreen shrubs. Cuttings of half-ripened shoots in sand, under a glass, in heat; sandy, fibry loam, and a little fibry peat. Winter temp., 55° to 60°; summer, 60° to 85°.

Prona'ya. (Named after *M. Pronay*, a French naturalist. Nat. ord., *Pittosporacæ*. Allied to *Sollya*.)

Greenhouse evergreen twiner. Cuttings of young shoots in sand, under a glass; sandy loam and peat. Winter temp., 40° to 48°.

- P. elegans*. 4. Blue. August. Australia. 1837. Syn., *Spiranthera Fraseri*.

Props are the supports required by plants to sustain them in a desired position. They must vary in height and strength accordantly with the plant to which they are applied, and should al-

ways be as slight as is consistent with efficiency. Nothing looks worse than a disproportioned prop or stake; indeed, it should be concealed as much as possible. The props for peas should be of the branches of the hazel, or of frames and strings, which we prefer; for runner kidney beans, rods of ash. For flowers, stout iron wire, painted dark green, is to be preferred. Whenever wooden props are used, the end thrust into the ground should be previously charred; if this precaution be taken, and when, no longer required, they are stored in a dry shed, they will last for several seasons. Props should be placed on the south sides of the plants, as they incline in that direction, as being that receiving most light.

The fewest possible number of props is one of the evidences of good cultivation and good taste.

Proserpina'ca. Mermaid Weed. (From *proserpo*, to creep; referring to the habit of the stems. Nat. ord., *Haloragacæ*.)

Half-hardy aquatic herbs. May be grown in ponds, or in pans of water with a little soil at the bottom.

- P. patris*. White. Summer. Canada. 1818.
 — *pectinata*. White. Summer. North America. 1821.

Proso'pis. (A name of a plant employed by Dioscorides. Nat. ord., *Leguminosæ*; Tribe, *Adenanthereæ*. Allied to *Neptunia*.)

Stove evergreen trees. Cuttings of young shoots, when a little firm, taken off close to the older stems, in sand, under a bell-glass, and in a little bottom-heat; sandy loam, and sandy fibry peat. Winter temp., 45° to 55°, and rather dry; summer, 60° to 85°, and plenty of moisture at root and top. *Siliquastrum* stood several years against a wall in the Horticultural Society's Gardens. *P. cumane'nsis*, *domingensis*, *du'lcis*, *ho'rrida*, and *siliquastrum* are sometimes regarded as varieties of *P. juliflora*.

 — *siliquastrum*. 30. White. Chili. 1827.

Prostanthe'ra. (From *prostheke*, appendage, and *anthera*, anther; connectives of the anthers are spurred. Nat. ord., *Labiataæ*; Tribe, *Prostanthereæ*.)

Greenhouse evergreen shrubs, from Australia. Frequently by seeds in a slight hotbed, in April; generally by cuttings of the young shoots in sandy soil; sandy peat, with plenty of fibre in it, and a portion of broken pots and charcoal nodules mixed with it, and good drainage. Winter temp., 38° to 48°. *Lasianthos* stood some years against a wall in the Gardens of the Horticultural Society.

Pro'tea. (From *Proteus*, a sea-god, who could transform himself into any shape; referring to the diversity of the species. Nat. ord., *Proteaceæ*; Tribe, *Protea*.)

Greenhouse evergreen shrubs, from South Africa. Cuttings of ripened young shoots, cut close to a joint, and the leaf there, and perhaps the one above, removed, the rest allowed to remain, inserted firmly in sand, over a little sandy loam, the pots being three-parts filled with drainage; the pots, with their cuttings, may then be set in a cold pit, and at such a distance from the glass that shading will be little required; the glasses should also be frequently wedged up at night to prevent damping; fibry loam, with a good portion of sand, and about a fourth part consisting of a mixture of charcoal, freestone, broken pots, and a little peat. Winter temp., 38° to 48°. These have not been tried against a wall, as they should be, with movable lights, or reed coverings, to be taken away in summer.

Pruning, as practised in the garden, has for its object the regulation of the branches to secure the due production of blossom and maturity of fruit. If carried to too great an extent that object is not attained, for every tree requires a certain amount of leaf-surface for the elaboration of its sap; and, therefore, if this be reduced too much, blossom-buds are produced less abundantly, for leaves are more necessary for the health of the plant; and by a wise provision, the parts less requisite for individual vigour are superseded by the parts more needed. On the other hand, if the branches are left too thick, they overshadow those beneath them, and so exclude the light and prevent that elaboration of the sap, without which no blossom-buds are formed, but an excessive production of leaves, in the vain effort to attain, by an enlarged surface, that elaboration which a smaller surface would effect in a more intense light. The appropriate pruning is given when considering each species of fruit-trees, and here we must confine

ourselves to a few general remarks. The season for pruning must be regulated, in some degree, by the strength of the tree; for although, as a general rule, the operation should not take place until the fall of the leaf indicates that growth has ceased, yet if the tree be weak, it may be often performed with advantage a little earlier, but still so late in the autumn as to prevent the protrusion of fresh shoots. This reduction of the branches before the tree has finished vegetating directs a greater supply of sap to those remaining, and stores up in them the supply for increased growth next season. If the production of spurs be the object of pruning a branch, it should be pruned so as to leave a stump; because, as the sap supplied to the branch will be concentrated upon those buds remaining at its extremity, these will be productive of shoots, though otherwise they would have remained dormant, it being the general habit of plants first to develop and mature those parts that are farthest from the roots. It is thus that the filbert is induced to put forth an abundance of young bearing wood, for its fruit is borne on the annual shoots, and similar treatment to a less severe extent is practised upon wall-fruit.

The chief guide in pruning consists in being well acquainted with the mode of the bearing of the different sorts of trees, and forming an early judgment of the future events of shoots and branches, and many other circumstances, for which some principal rules may be given; but there are particular instances which cannot be judged of but upon the spot, and depend chiefly upon practice and observation. *Peaches*, *Nectarines*, and *Apricots* all produce their fruit principally upon the young wood of a year old; that is, the shoots produced one year bear the year following; so that in all these trees a general supply of the best shoots of each year must be everywhere preserved at regular distances, from the very bottom to the extremity of the tree on every side; but in winter-pruning, or general shortening, less or more, according to the strength of the different shoots, is necessary, in order to promote their throwing out, more effectually, a supply of young wood the ensuing summer, in proper place for training in for the succeeding year's bearing.

Vines produce their fruit always upon the young wood-shoots of the same year, arising from the eyes of the last year's wood only; and must, therefore, have a general supply of the best regular shoots of each year trained in, which, in winter-

pruning, must be shortened to a few eyes, in order to force out shoots from their lower parts, only properly situated to lay in for bearing the following year.

Figs bear also only upon the young wood of a year old, and a general supply of it is, therefore, necessary every year; but these shoots must at no time be shortened, unless the ends are dead, because they always bear principally towards the extreme part of the shoots, which, if shortened, would take the bearing or fruitful parts away; besides, they naturally throw out a sufficient supply of shoots every year for future bearing, without the precaution of shortening.

Apple, Pear, Plum, and Cherry trees bear principally on spurs, arising in the wood of from two or three to ten or twenty years old, the same branches and spurs continuing to bear a great number of years; so that, having once procured a proper set of branches to form a spreading head, no farther supply of wood is wanted than some occasional shoots now and then to supply the place of any worn-out or dead branch. The above-mentioned spurs or fruit-buds are short, robust shoots of from about half an inch to one or two inches long, arising naturally, first towards the extreme parts of the branches of two or three years old, and as the branch increases in length, the number of fruit-buds increases accordingly.

In pruning, always cut quite close, both in the summer and winter-pruning. In the summer-pruning, if attended to early, while the shoots are quite young and tender, they may be readily rubbed off quite close with the thumb; but when the shoots become older and woody, as they will not readily break, it must be done with a knife, cutting them as close as possible; and all winter-pruning must always be performed with a knife.

Summer-pruning is a most necessary operation. Young shoots require thinning to preserve the beauty of the trees and encourage the fruit; and the sooner it is performed the better. It is, therefore, advisable to begin this work in May, or early in June, removing all superfluous growths and ill-placed shoots, which may be done with considerably more expedition and exactness than when the trees have shot a considerable length. Where, however, a tree is inclined to luxuriance, it is proper to retain as many of the regular shoots as can be commodiously trained in with any regularity, in order to divide and exhaust the too abundant sap. It will be necessary to review the trees occasionally, in order to reform

such branches or shoots as may have started from their places, or taken a wrong direction; and according as any fresh irregular shoots produced after the general dressing may be displaced, or as the already trained ones advance in length, or project from the wall or espalier, they should be trained in close.

In the winter-pruning, a general regulation must be observed, both of the mother branches, and the supply of young wood laid in the preceding summer; and the proper time for this work is any time in open weather, from the fall of the leaf in November, until March; but the sooner the better. In performing this work, it is proper to unnailed or loosen a chief part of the branches, particularly of peaches, nectarines, apricots, vines, and other trees requiring an annual supply of young wood.

Pru'nus. Plum. (From *prune*, a plum. Nat. ord., *Rosaceæ*; Tribe, *Pruneeæ*.)

Hardy deciduous trees, white or red flowered, and blooming in April. Seeds for varieties and stocks, suckers for grafting and budding; deep, loamy soil, if calcareous all the better. For the cultivated Plum, the Muscle and St. Julian stocks are generally used. When dwarfs are desired, the Myrobalan Plum is preferred. To obtain stocks in great plenty, the long shoots from the stools of last year's growth are laid down in the spring their full length, and covered with soil; almost every bud sends up a shoot, and roots are formed nearly contemporaneously. In autumn, the shoot laid down is cut off, and then cut into as many pieces as there are young shoots and roots. See PLUM.

Pseudo-bulb. By this term is described the fleshy stem of the orchids; and the term is applicable as it resembles a bulb more than a stem.

Pseudodraco'ntium. (From *pseudo*, false, and *Dracontium*; resembling the genus *Dracontium*. Nat. ord., *Aroidae*; Tribe, *Pythonieae*.)

Stove, tuberous herb. For culture, see AMORPHOPHALLUS.

- P. Laou'ri*. Leaves green, marked with round white dots. Cochinchina. 1878. B. M. t. 6673. Syn., *Amorphophallus Laouirii*. Ill. Hort. 1878, p. 90, t. 316.

Pseudogaltonia. (From *pseudo*, false, and *Galtonia*; resembling the

genus *Galtonia*. Nat. ord., *Liliaceæ*; *Tribe, Scilleæ*. Syn., *Lindneria*.)

Stove bulb.

P. Pechenii. 1. Greenish. Damaraland. 1890. Syn., *Lindneria fibrillosa*.

Pseudolarix. (From *pseudo*, false, and *Larix*; resembling the genus *Larix*. Nat. ord., *Coniferae*; Tribe, *Abietineæ*.)

Hardy tree. For culture, see PINUS.

P. Kämpferi. 120. China. Fl. Ser. t. 1777. G. C. 1834, xxii. p. 241. Syn., *Larix Kämpferi*.

Pseudopanax. (From *pseudo*, false, and *Panax*. Nat. ord., *Araliaceæ*.)

Greenhouse evergreen trees. For cultivation, see PANAX.

P. crassifolia. 10. Green. New Zealand. 1846. Syns., *Aralia crassifolia* and *Panax crassifolia*.

— *longissima*. 10. Green. New Zealand. 1866. Syns., *Panax longissima*, *Aralia crassifolia*, var. *picta* and *A. trifolia*.

Pseudophœnix. (From *pseudo*, false, and *Phœnix*; resembling the genus *Phœnix*. Nat. ord., *Palmeæ*; Tribe, *Phœniceæ*.)

Stove palm. For culture, see PHŒNIX.

P. Sargentii. 25. Fruit bright orange or red Florida. 1887. G. C. 1888, iv. p. 409.

Pseudotsuga. (From *pseudo*, false, and *Tsuga*. Nat. ord., *Coniferae*; Tribe, *Abietineæ*.)

Tall, hardy, evergreen trees, differing from *ABIES* in having reflexed cones with persistent scales.

P. Davidiana. China. 1873.

— *Douglasii*. 100-180. North America. 1826. Syns., *P. Lindleyana*, *Abies Douglasii* and *Pinus Douglasii*.

— *pendula*. 50. Branches drooping.

— *Starrii*. Young leaves creamy white. 1872. Garden variety.

— *Standishii*. Leaves silvery beneath.

— *taxifolia*. Dwarfier, but stouter than the type.

— *Lindleyana*. See *P. Douglasii*.

Psidium. Guava. (The Greek name once applied to the Pomegranate. Nat. ord., *Myrtaceæ*; Tribe, *Myrtacæ*. Allied to *Myrtus*.)

Stove, white-flowered evergreens. Cuttings of young shoots, getting a little firm at their base, in sand, under a bell-glass, and in bottom-heat; sandy, fibry loam and peat, with the addition of leaf-mould and a little dried cow-dung, provided the drainage is good and plentiful. Winter temp., 48° to 58°; summer, 60° to 85°. But several, such as *Cattleya num*, will not only live, but produce their fruit in a greenhouse. The best *Guavas* we have seen were produced on the back of a viney from which the frost was little more than excluded in winter. See GUAVA.

P. Araca. See *P. Donianum*.

Psilla. See Carrot Maggots.

Psilotum. (From *psilos*, naked; the leaves are few in number and very small. Nat. ord., *Lycopodiaceæ*.)

A curious, almost leafless, stove plant. Fibrous peat.

P. triquetrum. 2. Brazil and Central America. B. C. t. 1916.

Psoralea. (From *psoraleos*, warted; the appearance of some of the species. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*. Allied to *Amorpha*.)

Herbaceous, by division, as fresh growth commences; shrubs, by cuttings of the half-ripened shoots in April or May, in sand, under a glass; sandy peat, and sandy, fibry loam. Winter temp. for these, 40° to 48°. *Glandulosa* has stood in the open air for a number of years near London. There are some annuals and biennials, but not worth cultivating.

HARDY HERBACEOUS.

- *lineata*. See *Palicourea spicata*.
- *racemosa*. See *Palicourea racemosa*.
- *rigida*. See *Palicourea rigida*.

Psylla. The Chermes is allied to the Aphis. *P. pyri*, Pear Chermes, appears in May, not unlike a large Aphis, crimson-coloured, shaded with black. Mr. Kollar says, when pairing is over, the female lays her eggs in great numbers, near each other, on the young leaves and blossoms, or on the newly-formed fruit and shoots. They are of a longish shape, and yellow; and without a magnifying glass, they resemble the pollen of flowers. They are called either nymphs or larvæ in this state, according to the extent of their development; and, like their parents, have their mouth in the breast. After a few days, they change their skins,

and become darker, and somewhat reddish on the breast, and rather resemble bugs than plant-lice, having the extreme point of the body somewhat broad, and beset with bristles. After changing their skins, they quit the leaves, blossoms, and fruit, and proceed more downwards to the bearing wood and the shoots of last year, on which they fix themselves securely, one after the other, in rows, and remain there till their last transformation.

When the nymphs have moulted for the last time, and have attained their full size, the body swells out by degrees, and becomes cylindrical. They then leave their associates, and before they lay aside their nymph-like covering, they search out a leaf to which they fasten themselves firmly, and appear as if they were lifeless. After a few minutes, the skin splits on the upper part of the covering, and a winged insect proceeds from it. It is of a pleasant green colour, with red eyes and snow-white wings. It very much resembles its parents in spring, even in the colour. After a few days, this Chermes has assumed the colours of the perfect insect; the head, collar, and thorax are of an orange colour, and only the abdomen retains its green hue. It now flies away from the place of its birth to enjoy the open air.

P. mali (Apple Chermes). This, according to the same author, appears in June. In September, they pair, and lay their eggs, which are white, and pointed at both ends, a line and a half long, and the fourth of a line thick, and become yellow before the young escapes. The Apple Chermes lays its eggs in different places of the twigs of an apple-tree; usually, however, in the furrows of the knots, and sometimes in a very regular manner. The larvæ are scarcely escaped from the egg in the open air, when they hasten to the nearest bud, and begin to gnaw its scales. On the second day after their birth, they cast their first skin, after which they appear nearly of their former shape and colour. The second changing of the skin can sometimes be scarcely seen at all, because the larva not only puts out a thicker string with the tubercle, but also an immense number of very fine entangled threads or small hairs, which it turns upwards over its back, and with them entirely covers its body and head. In sunshine, these strings look transparent, as if they were made of glass, and become of a greenish variable colour. Under this screen the Chermes are secured from every attack of other insects; for no ants, mites, or

bugs can disturb them in their fortification, or consume them as their prey. After changing the second skin, the young assume a different colour and form; they now become light green all over, the abdomen much broader than the thorax, and on the side of the latter rudiments of the wings are distinctly seen. The third time of changing the skin comes on in about eight days, sometimes sooner and sometimes later, according to the weather. After this skin, the wing rudiments very distinctly make their appearance, and become larger and whiter the nearer the insect approaches to the perfect state. The body is also of a light green, and the larvæ have black eyes, and blackish antennæ. At last the time arrives when the insect assumes the perfect state; it then retires to a part of the leaf which it had selected, and after having firmly fixed itself there, the back splits open, and the beautiful-winged Chermes appears from the nymph. The back of the thorax is of a light green, the abdomen is marked with yellow rings, and the membranous wings with strongly-marked, snow-white veins.

P. crategi infests the camellia.

P. ficus and *P. rosæ* are found respectively on the fig and rose-trees. All the species are destroyed by syringing with tobacco-water until the insects are dead, and then syringing with water only. See **Aphis**.

Pta'r'mica. (From *ptarmikos*, sneezing. Nat. ord., *Compositæ*.) A synonym of **Achillea**. *P. grandiflora flo're ple'no* is a double-flowered form of *Achillea grandiflora*.

Pte'lea. Shrubby Trefoil. (From *ptao*, to fly; winged fruit. Nat. ord., *Rutaceæ*; Tribe, *Toddaliææ*.)

Pinnata requires a greenhouse; cuttings of ripe shoots in sand, under a hand-glass; sandy loam and peat. *Trifoliata* and its varieties are hardy; seed in April, and by layers in autumn; any common light soil.

P. ovata. See *Ptelidium ovatum*.

— *pinnata*. 20. White. May. Norfolk Island. 1829. Syn., *Blackburnia pinnata*.

— *variegata*. 12. Green. June. 1846.

Ptel'idium. (So named from its resemblance to *Ptelea*. Nat. ord., *Celastrinææ*; Tribe, *Celastrææ*.)

Stove evergreen shrub. Cuttings of young shoots in sand, under a glass, in heat; sandy peat and fibry loam, with pieces of charcoal. Winter temp., 50° to 60°; summer, 60° to 85°.

P. ovatum. 6. Greenish-white. Madagascar. 1818. Syn., *Ptelea ovatum*.

Pte'ris. Brake. (From *pteron*, a

wing; the shape of the fronds, or leaves. Nat. ord., *Filices*.)

All brown-spored. See **FERNs**.

Pterocarya. (From *pteron*, a wing, and *caryon*, a nut; winged fruit. Nat. ord., *Juglandaceæ*. Allied to *Juglans*.)

Hardy deciduous trees; by layers of the young shoots; also by grafting on the Walnut; deep, moist soil in warm places; in cold situations shallow, poor soil will be best, that the wood may not be stronger than the sun will ripen.

- P. cauca*'sica. See *P. fraxinifolia*.
 — *fraxifo*'lia. 40. Greenish. May. Caucasus and Eastern Europe. 1800. Syn., *P. caucasica*. Caucasian Walnut.
 — *rhoi*'fo'lia. Greenish. Japan.

 — *steno*'ptera. Greenish. China. 1882.

Pterocéphala. (From *pteron*, a wing, and *kephale*, a head. Nat. ord., *Dipsacææ*.) A synonym of *Scabiosa*.

Pterochilus. (From *pteron*, a wing, and *cheilos*, a lip. Nat. ord., *Orchidææ*; Tribe, *Epidendræ-Malaxææ*.) A synonym of *Microstylis*.

Pterococcus. (From *pteron*, a wing, and *kokkos*, a berry. Nat. ord., *Polygonacææ*.) A synonym of *Calligonum*.

Pterodiscus. (From *pteron*, a wing, and *discus*, a disk. Nat. ord., *Pedalineææ*; Tribe, *Pedaliææ*. Allied to *Martynia*.)

Stove herbaceous perennials. Seeds in spring and autumn; division of the plant, and cuttings of young shoots under a bell-glass, in the beginning of spring and in the middle of autumn; sandy loam and leaf-mould. Winter temp., 40° to 48°; summer, 60° to 75°.

- P. luridus*. 1½. Dull yellow. July. S. Africa. 1868. B. M. t. 5784.
— *speciosus*. 2. Lilac, purple. May. S. Africa. 1844. B. M. t. 4117.

Pterolo'bium. (From *pteron*, a wing, and *lobos*, a pod. Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpinicæ*.)

Stove, prickly shrub, the pods of which are produced into wings at the tip. For culture, see CÆSALPINIA.

- P. indicum*. Yellowish. East Indies. Syn., *Cæsalpinia lacerans*.

Pterolo'ma. (From *pteron*, a wing, and *loma*, a fringe. Nat. ord., *Leguminosæ*; Tribe, *Hedysarææ*.) A synonym of **Desmodium**.

Pteroneu'ron. (From *pteron*, a wing, and *neuron*, a nerve; winged seed-cord. Nat. ord., *Cruciferae*; Tribe, *Arabideæ*.) A synonym of **Cardamine**.

- P. carnosum*. See *Cardamine carnosæ*.
— *græcum*. See *Cardamine græca*.

Pteronia. (From *pteron*, a wing; feathery scales on the flower-receptacle. Nat. ord., *Compositæ*; Tribe, *Asteroidææ*. Allied to *Chrysocoma*.)

Greenhouse, yellow-flowered, evergreen shrubs, from South Africa. Cuttings of young shoots in sandy soil, under a hand-light; also by seeds in a slight hotbed, in spring, or in the greenhouse, in summer; fibry loam and sandy peat. Winter temp., 40° to 48°.

- P. camphorata*. 3. June. 1774. Syn., *P. stricta*.
— *Chamæpeuce rutilica*. A synonym of *Chamæpeuce rutilica*.
— *echinata*. A synonym of *Felicia echinata*.
— *fasciculata*. 2. June. 1818.
— *flexicaulis*. 3. July. 1812.
— *glomerata*. 2. June. 1817.
— *oppositifolia*. ½. July. 1774.
— *pa'llens*. 2. June. 1816.
— *pauciflora*. B. M. t. 1697. See *Helipterum virgatum*.
— *scariosa*. 2. July. 1815.
— *stricta*. See *P. camphorata*.

Pteropsis. (From *pteron*, a wing, and *opsis*, like; shape of the fronds, or leaves. Nat. ord., *Filices*.) A synonym of **Tænitis**.

- P. furcata*. See *Tænitis furcata*.

Pterospe'rmum. (From *pteron*, a wing, and *sperma*, a seed; winged seeds. Nat. ord., *Sterculiacææ*; Tribe, *Helictææ*.)

Stove, white-flowered, evergreen trees, from the East Indies. Cuttings of half-ripened, stubby side shoots, cut close to the stem, in sand, and in bottom-heat; sandy, fibry loam and lumpy peat, with good drainage. Winter temp., 50° to 55°; summer, 60° to 85°.

- P. acerifolium*. 10. August. 1790. B. M. t. 620.
— *platanifolium*. 15. 1820.
— *semisagittatum*. 10. 1820.
— *suberifolium*. 10. 1783. B. M. t. 1528. Syn., *Pentapetes suberifolia*.

Pteroste'lma. (From *pteron*, a wing, and *stelma*, a girdle. Nat. ord.,

Asclepiadacææ; Tribe, *Marsdeniææ*.) A synonym of **Hoya**.

Pterostigma. (From *pteron*, a wing, and *stigma*, the female organ. Nat. ord., *Scrophulariacææ*; Tribe, *Gratiolææ*.) A synonym of **Adenosma**.

Stove herbaceous perennial. Cuttings under a bell-glass in heat. Sandy peat.

- P. grandiflorum*. 3. Violet. Hong Kong. 1845. B. R. 1846, t. 16. A synonym of *Adenosma grandiflora*.

Pterostylis. (From *pteron*, a wing, and *stylis*, a column; in allusion to the broadly winged column. Nat. ord., *Orchideææ*; Tribe, *Neottiacæ-Diurideææ*. Allied to *Corysanthes*.)

Greenhouse terrestrial orchids. Divisions. Leaf-mould, lightened by the admixture of a little sand; the pots should be about one-third filled with broken crocks, before putting in the soil. No shade required. Summer temp., 60° to 80°; winter, 50° to 60°.

- P. acuminata*. ½. Green. April. N. S. Wales. 1827. B. M. t. 3401.
— *Banksii*. 1. Green. April. New Zealand. 1832. B. M. t. 3172.
— *Baptistii*. 1. Green, white, brown. Winter. Australia. 1877. B. M. t. 3651.
— *concinna*. ½. Purple-brown, green. N. S. Wales. 1828. B. M. t. 3400.
— *curta*. ½. Green. October. Australia. 1820.
— *nutans*. ½. Green. September. Australia. 1826. B. M. t. 3085.

Pterostyrax. (From *pteron*, a wing, and *Styrax*, the genus *Styrax*. Nat. ord., *Styracææ*.) See **Halesia**.

- P. hispidum*. See *Halesia hispida*.

Ptilomeris. (From *ptilon*, afeathered, and *meris*, a part. Nat. ord., *Compositææ*.) See **Actinolepis**.

- P. coronaria*. See *Actinolepis coronaria*.

Ptilotrichum. (From *ptilon*, a feather, and *thrix*, a hair. Nat. ord., *Cruciferae*; Tribe, *Alyssinææ*.) A synonym of **Alyssum**.

Hardy, white-flowered, deciduous shrubs. Cuttings in spring and summer; light, sandy soil; knolls and rock-works. The two species mentioned below are forms of *Alyssum canescens*.

- P. canescens*. April. Siberia. 1828.
— *elongatum*. April. Altai. 1836.

Ptychococcus. (From *ptyche*, a fold, and *coccus*, a berry. Nat. ord., *Palmeææ*; Tribe, *Areceææ*.)

- Stove palm. For culture, see **PTYCHOSPERMA**.
P. arecinus. 60. Java. 1884.

Ptychosperma. (From *ptyche*, a fold or winding, and *sperma*, a seed; probably in allusion to the ruminated albumen. Nat. ord., *Palmeææ*; Tribe, *Areceææ*. Syn., *Seaforthia*.)

Stove palms. Seeds, sown in a hotbed. Rich loam and leaf-mould, with a top-dressing of cow-dung. Summer temp., 65° to 85°; winter, 60° to 65°.

- P. Alexandrae*. 70. Australia. 1870. Fl. Ser. t. 1916. Now known as **ARCHONTO-PHENIX ALEXANDREÆ**.

- P. Cunninghamiana*. 60. Queensland. Syn., *Seaforthia elegans*, B. M. t. 4961. Now known as ARCHONTOPHENIX CUNNINGHAMIANA.
- *e'legans*. Central America. 1868.

- *pa'tula*. Sumatra.
- *regal'is*. India. 1867.
- *Ru'mphii*. See *Drymophlaeus oliveiformis*.
- *rupi'cola*. See *Lozococcus rupicola*.
- *Seema'nni*. New Guinea. 1879.
- *singapore'nsis*. See *Drymophlaeus singaporensis*.

Puccinia. A large genus of minute fungi, belonging to the order *Uredineae*, parasitic upon living plants. Most of

FIG. 1.

FIG. 2.

the members of this order have been proved to assume different forms in the course of their life history, which were formerly thought to be quite distinct genera. It has been found convenient to still designate the various forms by the old generic names, the final form being the Puccinia. The forms are :

1. **ÆCIDIDIUM**, or **CLUSTER-CUP**.—In this the fungus is embedded in the lower surface of the leaves, and covered by its own skin or *peridium*, which latter at length bursts and forms cups, such as are shown on p. 97. The upper figure (drawn diagrammatically and magnified about thirty times) is a vertical section of such a cup, showing the chains of *conidia* or reproductive bodies arising from its base, some of the upper ones breaking free. It also shows the filaments or *hyphae* penetrating the tissue of the leaf.

2. **UREDIDIUM**.—In this state the spores are not inclosed in a cup, but borne singly at the end of a hypha, as shown in the left-hand illustration of fig. 1.

Each spore consists of a single cell, much larger than that of the *Æcididium* stage, and is generally warted. Fig. 2 shows one of these spores germinating on the epidermis of a leaf, and the hypha thus produced entering the leaf through a pore or *stoma*.

3. **PUCGINIA**, or **TELEUTOSPORE**.—This is generally produced on the same host as the *Uredo*, but later in the season. The spores in Puccinia proper are two-celled, but in some allied forms vary from one to many-celled. These spores, like those of the *Uredo*, are borne singly at the end of a hypha. The right-hand, fig. 1, represents a teleutospore germinating. Sometimes several generations of one form are produced before proceeding to the next. See also *Æcidium*, *Barberry Fungus*, and *Hollyhock Fungus*.

Puccoon. *Sanguina'ria*.

Pudding. See **Mudding**.

Puera'ria. (Named after M. Puerrari, a Swiss botanist. Nat. ord., *Leguminosae*; Tribe, *Phaseoleae*. Allied to *Canavalia*.)

Greenhouse, yellow-flowered, evergreen climbers. Cuttings of half-ripened shoots in sand, under a glass; sandy peat and fibry loam. Winter temp., 40° to 48°.

P. Thunbergia'na. Violet, with yellow spot on the upper petal. Japan. 1889. Rev. Hort. 1891, p. 31, fig. 8. Syns., *Dolichos hirsutus*, *D. japonicus*, and *Pachyrhizus Thunbergianus*.

- *tuberosa*. 3. Yellow. Nepaul. 1806.
- *Walli'chii*. 3. Yellow. Nepaul. 1826.

Pulica'ria. (From *pulex*, a flea; the smell is supposed to drive fleas away. Nat. ord., *Compositae*; Tribe, *Inuloideae*.)

Hardy, herbaceous perennial. For culture, see **INULA**.

- P. odora*. 1½. Yellow. July. South Europe. 1801. Syn., *Inula odora*.

Pulmona'ria. Lungwort. (From *pulmonarius*, diseased lungs; referring to its supposed efficacy in those diseases. Nat. ord., *Boragineae*; Tribe, *Boragae*.)

Hardy, herbaceous perennials. Divisions in spring; common garden-soil.

- P. angustifolia*. ¾. Violet. April. Britain. Eng. Bot. ed. 3, t. 1097. Syn., *P. azurea*. Blue Cowslip.

- — *oblonga'ta*. See *P. vulgaris*.

 — *virginica*. B. M. t. 160. A synonym of *Mer-*
tensia pulmonarioides.
 — *vulgaris*. 1. Pink. May. Central Europe.
 1824. Syns., *P. angustifolia*, var. *ob-*
longata, *P. oblongata*, and *P. tuberosa*.

Pultenæ'a. (Named after Dr. Pul-
 teney. Nat. ord., *Leguminosæ*; Tribe,
Podalyriæ. Allied to *Gastrolobium*.)

Greenhouse, yellow-flowered, evergreen shrubs,
 from Australia. Cuttings of the points of shoots
 as growth is nearly finished, or, better still, small
 side-shoots, when from two to three inches long,
 in sand, in April, under a bell-glass; two parts
 of sandy, fibry peat to one part of fibry loam,
 with a little charcoal and good drainage. Win-
 ter temp., 40° to 48°; summer, 60° to 75°. Plenty
 of air, and screened from the full sun during the
 hottest period of the year.

villosa.

Pu'nica. Pomegranate. (From
puniceus, scarlet; the colour of the
 flowers. Nat. ord., *Lythariæ*.)

Deciduous trees, all blooming in August.
 Cuttings of the shoots and roots; layers and
 grafting; any light, rich soil. It flourishes
 against a wall, but in such places the twigs
 must be encouraged to grow, or there will be
 few flowers. The double kinds grafted on the
 single, and grown in rich loam, become nice
 flowering plants, as the plants do not grow so
 vigorously as on their own roots, but flower
 much longer. The variety *na'na* requires the
 stove.

- P. Grana'tum*. 18. Red. South Europe. 1548.
 B. M. t. 1832.

 flowered. Garden variety.
 — *na'na*. 3. Red. South America. 1723.
 Syn., *P. nana*.
 — *rubrum flo're'ple'no*. 10. Red. South
 Europe. Syn., *P. Granatum*, var.
plenum.
 — *na'na*. B. M. t. 634. See *P. Granatum*, var.
nana.

Punnet. See **Basket**.

Pupa. The name applied to one of
 the stages in the life of an insect. In
 some insects, e.g., Butterflies, it is the
 resting state, and is known as the chry-
 salis; in others, e.g., Grasshoppers, it
 is active, and somewhat resembles the
 perfect form.

Pupa'lia. (From *Pupali*, the East
 Indian name. Nat. ord., *Amarantha-*
cæ.)

Stove evergreen sub-shrub. Sandy loam. Cut-
 tings in sand, in heat, under a bell-glass.

- P. atropurpurea*. 2. Dark purple. September.
 Tropics of the Old World. 1756.

Purification Flower. *Gala'nthus*
nivalis.

Purple Carrot-seed Moth. *De-*
pressa'ria depressella.

Purple Loose-strife. *Ly'thrum*
salicaria.

Purple Medick. *Medica'go sati'va*.

Purple Wreath. *Petra'ea volu'bi-*
lis.

Pu'rshia. (Named after F. Pursh,

a writer on American plants. Nat. ord., *Rosaceæ*; Tribe, *Potentilleæ*.) A genus of doubtful affinity.

Hardy evergreen shrub. Cuttings of young shoots in sand, under a hand-light, in early summer; also by seeds, treated as rose-seeds; sandy, poor soil.

P. hispida. A synonym of *Onosmodium hispidum*.

— *mollis*. A synonym of *Onosmodium molle*.
— *tridentata*. 2. Yellow. N. Amer. 1826. B. R. t. 1446.

Purslane. (*Portulaca*.) *P. oleracea*, Green, or Garden Purslane. *P. sativa*, Golden Purslane.

They thrive best in a light, rich soil, and prefer a warm situation, such as a south border. Sow in February and early in March, in a moderate hotbed, to remain where sown; and at the close of March, and once monthly, during April, May, and the summer months until the end of August, in the open ground.

Sow in drills six inches apart, very thin, and not more than a quarter of an inch deep. Keep the seedlings clear of weeds, and thin to six or eight inches asunder. In dry weather water moderately two or three times a week.

In general, they are ready for gathering from in six weeks after sowing, the young shoots being made use of from two to five inches in length, and the plants branch out again.

The hotbed crops require the air to be admitted as freely as the weather permits, the temperature ranging between 50° and 70°.

To obtain Seed.—A few of the earliest border-raised plants must be left un-gathered from, the strongest and largest-leaved being selected. They must be cut immediately the seed is ripe, laid on a cloth, and when perfectly dry, thrashed, and the refuse is best separated by means of a very fine sieve.

Purslane-tree. *Portulaca*'*ria*.

Puschkinia. (Named after *M. Pouschkin*, a Russian botanist. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*. Allied to Hyacinth.)

Half-hardy bulb. Offset-bulbs; deep, sandy loam; requires a little protection, or to be taken up in winter.

P. scilloides. $\frac{1}{2}$. Pale blue. May. Siberia. 1819. B. M. t. 2244.
— *sicula*. $\frac{1}{2}$. Blue. Sicily. 1875.

Puss Moth. *Dicranura*'*ra vinula*.

Puto'ria. (From *putor*, a strong smell; the leaves have a strong odour. Nat. ord., *Rubiaceæ*; Tribe, *Spermacoceæ*.)

Dwarf, hardy, much-branched shrub. Gravelly soil. Divisions.

P. calabrica. $\frac{1}{2}$. Red. July. Mediterranean region. 1820. Syns., *Asperula calabrica*, *Ernodea montana*, Sibth. Fl. Gr. t. 143, and *Pavetta fetidissima*.

Putterli'ckia. (After *A. Putterlick*, a Viennese botanist, 1810-1845. Nat. ord., *Celastrineæ*.)

Greenhouse shrub. For culture, see CELASTRUS.

P. Pyracantha. 3. Green, purple. Winter. South Africa. Syn., *Celastrus Pyracanthus*, B. M. t. 1167.

Putty is a compound of boiled linseed-oil and whiting, but as it may be bought in London at half-a-guinea per cwt., it is scarcely worth while to make it. One hundredweight is enough for puttying about three hundred square feet of glass.

Old putty may be softened by applying to it rags dipped in a saturated solution of caustic potash, leaving them on for twelve hours; or by rubbing a hot iron along the putty.

If the gardener does make putty, the whiting should be well dried, and then pounded and sifted till it becomes a fine powder, and is quite free from grit. The whiting, a little warm, should be gradually added to the oil, and well-mixed by means of a piece of stick, or a spatula. When it is sufficiently stiff, it should be well worked with the hand on a table, and afterwards beaten on a stone with a wooden mallet till it becomes a soft, tenacious mass. A ball of putty, when left some days, becomes somewhat hard, but may be easily softened by beating.

Pu'ya. (Native name. Nat. ord., *Bromeliaceæ*; Tribe, *Pitcairnieæ*.)

Stove herbaceous perennials, except *magnipspatha*, which is a stove epiphyte. Seeds in a hotbed, but chiefly by suckers; sandy loam and peat. Winter temp., 55° to 60°; summer, 60° to 85°.

P. Acapulca. A synonym of *Pitcairnia Bonplandii*.

Pycnostachys. (From *pyknos*, dense, and *stachys*, a spike; dense flower-spikes. Nat. ord., *Labiatae*; Tribe, *Ocimoideae*.)

- Stove annual. For culture, see OCIMUM.
P. caerulea. 3. Blue. August. Madagascar. 1825.
 — *urticifolia*. Blue. Tropical Africa. 1863. Sub-shrub. B. M. t. 5365.

Pyrethrum. Feverfew. (From *pyr*, fire; alluding to its acrid roots. Nat. ord., *Compositae*; Tribe, *Anthemideae*.) In Bentham and Hooker's *Genera Plantarum* this genus is united to **Chrysanthemum**, but for garden purposes it may be regarded as distinct. The names the various species would bear in *Chrysanthemum* are here appended as synonyms.

All white-flowered, except where otherwise mentioned. Hardy kinds, divisions and seeds, and common garden-soil; greenhouse kinds, by cuttings under a hand-light, in sandy, light soil; sandy, fibry loam, and leaf-mould; half-shrubby kinds, such as *feniculatum*, will not only do well in cold greenhouses, but will probably answer for the bottom of conservatory walls.

Pyrolirion. Flame Lily. (From *pyr*, fire, and *lirion*, a lily. Nat. ord.,

Amaryllidæ; Tribe, *Amaryllææ*.) A synonym of **Zephyranthes**.

Very rare greenhouse bulbs, flowering about Midsummer, before the leaves are full-grown, and require rest from December to April. Offset-bulbs; sandy loam and leaf-mould; a greenhouse or a cold pit.

P. aureum. See *Zephyranthes aurea*.
— *faucæ laevi*. B. R. t. 1724. See *Zephyranthes flava*.
— *flavum*. See *Zephyranthes flava*.

Pyrrheïma. (From *pyrrhos*, red, and *eima*, clothing; from the reddish-brown hairs which clothe the whole plant. Nat. ord., *Commelinacææ*; Tribe, *Tradescantiææ*.) A synonym of **Tradescantia**.

Stove perennial herb. Seeds in a hotbed as soon as ripe; divisions. Rich sandy loam and leaf-mould, or a little peat. Summer temp., 65° to 85°; winter, 60° to 65°.

P. Loddigei. See *Tradescantia fuscata*.

Pyrus. Pear-tree. (From *pirus*, name used by Pliny. Nat. ord., *Rosacææ*; Tribe, *Pomeææ*.)

Hardy deciduous trees, white-flowered, except where otherwise mentioned. Seeds for stocks and new varieties; as, also, in the case of the timber-trees, for the continuance of the species; but for all particular sorts, by budding and grafting upon wild pears, apples, quinces, and thorns, according to the future effects required; also by suckers; good garden-soil, and deep, loamy soil for the wild varieties. See PEAR and QUINCE.

Py'rus Malus or **Apple.** The varieties of the apple are now extremely numerous, so that it is possible to give here the names of but a few of the most desirable. Those varieties should be selected for growing which are most adapted to the soil of the locality, as disappointment is often caused through a variety, which has thrived well in one part of the country, failing to produce a remunerative crop in another.

Espalier and dwarf. Dessert kinds.

— Lamb-abbey Pearmain; Hick's Fancy; Kerry Pippin; Sturmer Pippin; Ribston Pippin; Pitmaston Nonpareil; Boston Russet; Claygate Pearmain; Keddlestone Pippin; Mr. Gladstone; Old Nonpareil; Braddick's Nonpareil; Scarlet Nonpareil; Pearson's Plate; Court-penduplat; Court of Wick; Golden Drop; King of Pippins; Margille; Golden Reinette; Reinette du Canada; Reinette Grise; Van Mons Reinette; Sturmer Pippin; Red Quarrenden; Adam's Pearmain; Boston Russet; Baddorn; or Spring Ribston Pippin; Early Harvest; Early Margaret; Golden Harvey.

Standard. Dessert.—Hick's Fancy; Kerry Pippin; Pitmaston Nonpareil; Court of Wick; King of Pippins; Golden Reinette; Adam's Pearmain; Boston Russet; Early Harvest; Early Margaret; Summer Pippin; Ribston Pippin.

Espaliers and dwarfs.—*Kitchen.*—Hawthornden; Alfriston; Pitmaston Nonpareil; Manks Codling; Wareham Russet; Blenheim Orange; Chappell; Keswick Codling; Waltham - Abbey Seedling.

Standard. Kitchen.—Alexander; Northern Greening, or John; Mank's Codling; Chappell; Wareham Russet; Blenheim Orange; Blenheim Pippin; Normanton or Dumelow's Seedling;

Gravenstein; Jolly Beggar; Keswick Codling; Hawthornden; New or Winter Hawthornden; Bedfordshire Foundling; Brabant Bellefleur; Cellini; Reinette du Canada; Emperor Alexander; Non-such; Norfolk Beeing; Small's Admirable; Worcestershire Pearmain; Dutch Codling; Wormsley Pippin; Waltham Abbey Seedling; Alfriston; Court Pendu Plat; D. T. Fish; French Crab.

For walls.—Ribston Pippin; Old Nonpareil; Newtown Pippin; Sturmer Pippin.

Propagation by seed.—Sow in autumn the largest and most convex seeds of a favoured variety, in pots, or a border of light, rich loam; bury the seed an inch deep; if in a border, six inches apart each way. Mr. Loudon says, "The end of the first year they should be transplanted into nursery rows, from six inches to a foot apart every way. Afterwards they should be removed to where they are to produce fruit; and for this purpose the greater the distance between the plants the better. It should not be less than six or eight feet every way. The quickest way to bring them into a bearing state, Mr. Williams of Pitmaston considers, is to let the plants be furnished with lateral shoots, from the ground upwards, so disposed as that the leaves of the upper shoots may not shade those situated underneath, pruning away only trifling shoots.

"He adopted this mode, and succeeded in producing fruit from seedling apples at four, five, and six years of age, instead of waiting eight, ten, and even fifteen years, which must be the case by the usual mode of planting close, and pruning to naked stems."

The advice of Mr. Williams is very good: but we must remind our readers that most of our shy, flowering, arborescent, or shrubby plants or trees are soonest brought to blossom by first encouraging a high amount of luxuriance, and then inducing a severe check by root-pruning.

By such means, carefully carried out, there can be no doubt that seedling apples may be made to blossom in four years. The check may either consist in a severe root-pruning, or the plants may be transplanted; taking care to prune away all taper-forked roots, and using all possible means to encourage surface fibres.

We may add here, that the less pruning of the shoots the better; the knife is a great enemy to early fruitfulness in young trees, especially codlings.

Most good cultivators—and we be-

lieve we may include the highly-scientific authority of the late Mr. Knight, of Downton—prefer grafting the shoots of seedling apples, when two years old, on very old, healthy, and fine bearing kinds. In doing so, the extremities of the best branches should be chosen, as also, the lightest portion of the tree, which should stand in a sheltered and warm situation.

Mr. Knight states that “the width and thickness of the leaf generally indicate the size of the future apple, but will by no means convey any correct idea of the merits of the future fruit. When these have the character of high cultivation, the qualities of the fruit will be far removed from those of the native species; but the apple may be insipid or highly flavoured, green or deeply coloured, and of course, well or ill calculated to answer the purposes of the planter. An early blossom in the spring, and an early change of colour in the autumnal leaf, would naturally be supposed to indicate a fruit of early maturity; but I have never been able to discover any criterion of this kind on which the smallest dependence may be placed.

“The leaves of some varieties will become yellow and fall off, leaving the fruit green and immature; and the leaves in other kinds will retain their verdure long after the fruit has perished. The plants whose buds in the annual wood are full and prominent, are usually more productive than those whose buds are small and shrunk in the bark; but their future produce will depend much on the power the blossoms possess of bearing the cold; and this power varies in the varieties, and can only be known from experience. Those which produce their leaves and blossoms rather early in the spring are to be preferred; for, though they are more exposed to injury from frost, they less frequently suffer from the attacks of insects—the more common cause of failure. The disposition to vegetate early or late in the spring is, like almost every other quality in the Apple-tree, transferred in different degrees to its offspring; and the planter must therefore seek those qualities in the parent-tree which he wishes to find in the future seedling plants. The best method I have been able to discover of obtaining such fruits as vegetate very early in the spring, has been by introducing the pollen of the Siberian crab into the blossom of a rich and early apple, and by transferring, in the same manner, the pollen of the apple to the

blossom of the Siberian crab. The leaf and the habit of many of the plants that I have thus obtained possess much of the character of the apple, whilst they vegetate as early in the spring as the crab of Siberia, and possess at least an equal power of bearing cold; and I possess two plants of the family which are quite as hardy as the most austere crab of our woods.”

By grafting.—Stocks of the crab and apple are raised from kernels; but the Codling and Paradise stocks must be raised by cuttings and layers. Sow in autumn, in beds of light earth, moderately thick, in drills, covering them half an inch deep; they will come up in the spring, when, if the season proves dry, water them occasionally, which will greatly forward the seedlings, and strengthen their growth; and in the autumn, winter or spring following, they may be planted out in nursery rows, previously shortening their tap-roots, and planting them in lines two feet and a half apart, and one foot in the rows; and, after having grown from one to two or three years here, they will be fit for grafting, particularly if for dwarfs, or even for full and half standards, if it is intended to form the stem from the graft, which is an eligible method for these trees; but if the stock is to form the stem, they will require three or four years' growth to rise to a proper height; seven feet for full, and four or five for half standards. When these trees are intended for full-sized orchard standards, with strong stems, and the too common practice of pruning close all side-branches, as they spring from the stem, cannot be too strongly deprecated. A regular series of these should be left up the stem at least for one year after their production, practising what is termed “spurring in” by our nurserymen, at the first winter's pruning after their production. Indeed, in the second year, if any stout stems are required, we would only totally remove one-half; and instead of performing this operation in the winter, we would leave it until near midsummer; for recent wounds heal, and skin over much nicer at that period than during the season of rest.

Before quitting the subject of grafting, it may be well to offer a few plain directions. Presuming that stocks, duly cultivated and prepared, exist, the first thing is to provide scions; that is, a part of the kind intended to be grafted on the stocks. It is, and has been a maxim, for perhaps centuries, to procure

these long before what is termed the "rising of the sap," that is to say, during the resting season.

Such, then, being procured during the end of January or through February, they are "heeled;" that is, after being correctly labelled and tied in bundles, they are placed in the earth, in a cool and damp situation, where neither sun nor wind can penetrate. Here they lie until wanted. There appears to have been originally more than one reason for this procedure. A pressure of spring business, even in former days, would suggest this practice, and it would soon be discovered that these retarded scions possessed real advantages; the principle of which appears to be the certainty of nourishment the moment they are placed in the parent plant, or, at least as soon as their absorbing powers are fully in action, which will be the case in a day or two. The parent stock is thus much in advance of them; and a root-action has already commenced, which is capable of supplying their utmost need. The period of grafting is determined by the rising of the sap; and this is indicated, in deciduous trees, by the enlargement of the buds, which generally takes place in the early part of March, in Britain. We consider that the buds of the stock should be near bursting their skin before grafting should take place.

This, of course will differ, in different fruits, as differ their degrees of precocity. For details of the process, see **Grafting**.

By cuttings.—All the varieties may be raised in this mode, though some, as the Burr-knot, Codling, and June-eating, more readily than others. Trees so raised are said not to be so liable as their parents to canker. In February take cuttings of the young shoots from some of the horizontal branches, about eight inches long, cutting off a portion of the old wood of the branch attached to the shoot; remove all the buds except the upper three. Plant these firmly in sandy loam giving water, and covering with a hand-glass, until the cuttings have well vegetated. Shade from the midday sun; remove the hand-glass in July, and get the plants into the nursery early in November.

Soil.—The apple prefers a deep and strong, or adhesive loam. The colour is not so very material, providing such rests on a sound subsoil, free from water lodgments. If it is not so naturally, draining must be had recourse to, or it will be vain to expect success. They are nevertheless cultivated with con-

siderable success on any ordinary garden-soil; and even on soils of a peaty character we have known them to succeed tolerably well; but in the latter case, the peat must be previously solidified by drainage, culture, etc., for a few years, for we have never known them succeed on raw, elastic peats. Improved peats, indeed, will in due time approach the character of common, dark, garden-soils; and it becomes expedient for the apple to introduce both marl and clay, and also sand. Whenever a suspicion exists of an ungenial soil, the best plan is to plant on stations; which, indeed, is the best plan to adopt in all kitchen-gardens where the object is to get great variety in small compass or to induce early bearing. See article **Stations**.

Planting.—The soil should be trenched, and immediately beneath each tree, according to the extent of its roots, chalk, stones, or brickbats rammed so as to form a kind of pavement, to direct the roots horizontally. Plant so that the roots nearest the surface are twelve inches below it. See **Stations**.

Espaliers.—When first planted, the young plant is cut down to within about a foot of the ground, and only three shoots permitted to spring from it, one of which will be the leader, and the others will form the first or lower tier of bearing branches, which are to be secured to small stakes, so as to keep them in their proper places.

The following season the upright leader must be shortened to nine inches or a foot above the two horizontal branches, and deprived of all its shoots, excepting the three uppermost, which are to be treated the same as before. In this way the leading shoot is to be stopped at the requisite distance above the horizontal ones until it has reached the height of five feet. It is then cut off and no more allowed to grow upright, the whole strength of the tree being directed to the fruiting branches.

Espalier apple-trees should be planted at not less than twenty feet distance; but five and thirty feet is better, especially for trees grafted on Crab or Applestocks, which are free growers. For trees grafted on Codling or Paradise stocks, eighteen or twenty feet may be a sufficient distance. They should be planted with their heads entire, only removing any very irregular growths that do not range consistent with the intended form, and pruning any broken roots; as, also the points of immature wood. Let all the branches be trained horizontally to the right and left, an

equal number on each side, all at full length, five or six inches asunder; and, according as they shoot in summer, still continue them along entire. At the same time, train in a further supply of new shoots, to increase the number of horizontals or bearers; and thus continue increasing their numbers every year, till the espalier is regularly filled from the bottom to the top, preserving all the branches at full length, as far as the allotted space will admit.

They must have a summer and a winter pruning annually. In the summer cut out all the superfluous and ill-placed shoots of the year, and train regular ones towards the lower parts in vacant spaces, at least to remain till winter, some of which may then be wanted to fill some unforeseen vacancy, clearing out all others at this time as close as possible, and in winter, if any worn out or decayed parts appear, then is the time to retrench them, retaining young branches in their places, and if any vacancy occurs, retain some contiguous young shoot to fill it. Cut clean and close to the branches, still continuing all the branches, and any occasional supply of shoots at full length, as far as their limited bounds will allow; then train the whole regularly, tying them in as straight and close to the railing as possible, about six inches apart.

Standards, Half-Standards, and Dwarfs.—The standards having been trained in the nursery, with tolerably good heads, should be planted with those heads nearly entire, merely pruning away late growths, and occasionally shortening, to produce new shoots when desirable. If any are intended for the kitchen-garden, plant them at least forty feet apart; and, for a full plantation, to form an orchard, allow thirty feet distance every way.

Trim any broken or tap roots, but leave all the others entire.

As soon as planted, let every one be well staked, to support them firmly upright, and prevent them from being disturbed in rooting by winds.

Smaller-growing standards, such as Codlings and dwarfs upon Paradise stocks, may, if required, be planted at only twenty feet apart, or even less, though if there is room to allow a greater distance it will be of greater advantage.

Let them also, in future, advance with all their branches at full length, taking their own natural growth, and they will soon form numerous natural spurs in every part for bearing.

With respect to pruning these standards, very little is required, probably not more than once in three years, and then only the retrenching any very irregular, cross-placed bough, or reducing to order any very long rambler; or, when the head is become greatly crowded and confused, to thin out some of the most irregular growth, likewise all strong shoots growing upright in the middle of the head, and all dead wood and suckers from the stem and root. See **Pruning**, also **Station**.

Manuring old Apple-trees.—We generally see fruitful old trees starving by inches; few think of manuring them. The consequence is, not only premature decay in the tree, but a continual sacrifice in produce; and if there be a full crop, the apples either crack, or become corroded with a rusty fungus, under which circumstances they will lose, in a great degree, their keeping properties. The best way to deal with such cases is to strip away, at the end of October, six inches of the surface-soil, and to apply a coating of the very slutch of the manure-yard three or four inches in thickness; after which, the turf or some soil may be strewed over, to prevent the loss of its fertile properties. This, once in three years, accompanied by a rather severe thinning or pruning, will be found to renew the constitution of the tree in a very considerable degree; the fruit, also, will regain their size, their clear skin, and, of course, their keeping properties.

Diseases.—See **Canker**, **Russet**, and **Moss**.

Insects.—So impressed was Mr. Knight with the opinion, that of all our fruits none suffers more from insects than the Apple, that he declared his belief that these are a more frequent cause of the crops failing than frost. The figure-eight moth (*Dilo'ba cæruleoce'phala*), Linnaeus denominates the pest of Pomona, and the destroyer of the blossoms of the apple, pear, and cherry. He also mentions another (*T'inea cortice'lla*), as inhabiting apple-bearing trees under the bark. Reaumur has given us the history of a species common in this country, and producing the same effect, often to the destruction of the crop, the caterpillar of which feeds in the centre of our apples, thus occasioning them to fall. Even the young grafts are frequently destroyed—sometimes many hundreds in one night—in the nurseries about London, by the *Curculio vastator* of Marsham (*Otiory'nchus p'icipes*), one of the short-nouted weevils; and the foundation of canker, in full-grown trees, is often laid

by the larvæ of *Tema'sa Wæbera'na*. The sap, too, is often injuriously drawn off by a minute coccus, of which the female has the exact shape of a mussel shell (*Co'ceus arborum linearis*), and which Reaumur has accurately described and figured. But the greatest enemy of this tree, which has been known in this country since the year 1787, is the apple-aphis, called by some the coccus, and by others the American Blight. See **American Blight, Blight Yponomena, Anthonymus, Coccus, Psylla, Bostrichus, Scolytus and Acarus.**

Pyxida'nthera. (From *pyxis*, a box, and *anthera*, an anther; referring to its form. Nat. ord., *Diapensiaceæ*.)

This genus at present only contains *DIAPENSIA barbulate*. See that genus for culture.

P. barbulate. †. White or rose. June. New Jersey. 1861. B. M. t. 4592. Syn., *Diapensia barbulate*. Pine-barren Beauty.

Q.

Quaking Grass. *Bri'za*.

Qualea. (The name in Guiana. Nat. ord., *Vochysiaceæ*. Allied to *Vochysia*.)

Stove evergreen tree. By seeds in a hotbed, and cuttings of half-ripened shoots in sandy soil, under a bell-glass, and in bottom-heat; peat and loam. Winter temp., 50° to 60°; summer, 60° to 85°.

Q. rosea. Violet. Brazil. 1824. Syn., *Q. violacea*.

Quamoclit. (From *kyamos*, a kidney-bean, and *klitos*, dwarf; resemblance of habit. Nat. ord., *Convolvulaceæ*; Tribe, *Convolvuleæ*.) This should have been united to *Ipomæa* under the specific names annexed. Allied to *Ipomæa*.

Seeds in a hotbed, and cuttings of the points and side-shoots of growing stems, the former plan being adopted chiefly with annuals, and the latter with perennials; the annuals being generally grown out of doors after the end of May, and the perennials in the plant stove.

GREENHOUSE CLIMBER.

Qua'qua. (The name given to this plant by the Hottentots, who eat the stems raw. Nat. ord., *Asclepiadaceæ*. Allied to *Boucerosia*.)

For cultivation, see *HOODIA*.

Q. hottentotorum. †. Yellow. Summer. Namaqualand. 1878.

Qua'ssia. (From the name of a slave (*Quassi* or *Coissi*), who first used the bark as a febrifuge. Nat. ord., *Simarubaceæ*.)

Stove evergreen tree, the source of the well-known *Quassia*-chips, used for poisoning flies; the bitter has also been substituted for hops. Cuttings of ripe shoots in sand, under a bell-glass, in heat; sandy, rich loam and fibry peat. Winter temp., 55° to 65°; summer, 65° to 90°.

Q. amara. 20. Red. June. Guiana. 1790. B. M. t. 497. Syn., *Q. Simaruba*.

— *exco'tsa*. See *Simaruba exco'tsa*.

— *Simaruba*. See *Q. amara*.

Quebec Oak. *Que'rcus a'lba*.

Queen Lily. *Phædrana'ssa*.

Queen of the Meadows. *Spiræ'a Ulma'ria*.

Queke'ttia. (In honour of the late *E. J. Quekett, F.L.S.*, author of several works on vegetable anatomy. Nat. ord., *Orchidæ*; Tribe, *Vandæ-Oncidieæ*.)

Stove orchid, requiring the same culture as *PLEUROTHALLIS*.

Q. microscopica. †. Yellow. Brazil.

Quenouille is a fruit-tree with a central stem, and its branches trained in horizontal tiers, the lowest being the longest, and the others gradually lessening in length as they do in age; so that the tree, like a spruce-fir, acquires a pyramidal form.

Quercitron. *Que'rcus tinctoria*.

Que'rcus. The Oak. (From the Celtic *quer*, fine, and *cuez*, a tree. Nat. ord., *Cupulifereæ*; Tribe, *Quercineæ*.)

By acorns, sown as they drop from the tree, or collected, dried, and kept packed in sand, in a dry place, until the following March, when they may be sown in rows, and covered half an inch deep; deep, loamy soil they like best. Particular varieties are kept up by grafting.

Quickset, the same as the Hawthorn, or Whitethorn, *Crataegus oxyacantha*. See **Hedge**.

Quilla'ja. (From *quillai*, the Chilean name. Nat. ord., *Rosaceae*; Tribe, *Quillajaceae*. Allied to *Kageneckia*.)

Hardy evergreen shrub, the bark of which is used instead of soap. Cuttings of ripened shoots in sandy loam, under a hand-light, and very likely by layers; sandy, deep loam, and a sheltered place.

- Q. saponaria*. White. April. Chili. 1832. Syn., *Q. Molinae*.

Quina, Quinquina, or Quino. *Cincho'na*.

Quince. *Cydonia vulgaris*.
Varieties.—Common, Apple-shaped, Pear-shaped, and Portugal. The last is the best, and very distinct from the others. *C. sine'nsis*, the Chinese Quince, has been fruited in this country, but it requires a wall. The fruit is very different from that of either the Common or Portugal Quinces; it is cylindrical, about six inches in length, and exceedingly gritty.

Culture.—The trees may be raised from

seed sown in autumn, but there is no certainty of having the same, or any good fruit from the seedlings. The several varieties may be propagated by cuttings and layers; also by suckers from such trees as grow upon their own roots, and by grafting and budding upon their own or pear stocks.

Cuttings, layers, and suckers may be put in in autumn or early spring. Choose young wood for the cuttings and layers. They will be rooted by next autumn; then transplant into nursery rows two feet apart. Plant the suckers also at the same distance, and train the whole for the purposes intended; if for standards with a stem, to any desired height, from three to six feet; then encourage them to branch out at top, to form a head; and those designed as dwarfs must be headed near the ground, and trained accordingly, for espaliers or dwarf standards.

When they have formed tolerable heads, plant them out finally. Standard quinces, designed as fruit-trees, may be planted in the garden or orchard, and some by the sides of any water in bye places, suffering the whole to take their own natural growth; and as espaliers, they may be arranged with other moderate-growing trees, about fifteen feet apart. For other particulars of culture, see **Pear**.

Quince, Bengal. *Ægle marmelos*.

Quincunx is the form resulting from planting in rows, with one plant opposite the centre of each vacancy between two plants in the row on each side of it, as in this diagram :

Quinine. A product of several species of *Cinchona*.

Quinsy-berry. *Ribes nigrum*.

Quisqualis. (From *quis*, who, and *qualis*, what kind; when first named it was doubtful to which class and order to refer it. Nat. ord., *Combretaceæ*. Allied to *Combretum*.)

Stove climbers. Cuttings of the young shoots when several inches in length, after the plant has been stumped in after-flowering, taking the cuttings off with a heel, and inserting them in sand, under a bell-glass, and in bottom-heat; peat and loam, but most of the latter. Winter temp., 43° to 50°; summer, 60° to 88°.

Q. glabra. See *Q. indica*.

— *indica*. 20. Orange, red. June. Tropical Asia and Africa. 1815. B. M. t. 2033.

Slight forms of this are *Q. glabra*, *Q. pubescens*, *Q. sinensis* and *Q. villosa*.
Q. pubescens. See *Q. indica*.
 — *sinensis.* B. R. 1844, t. 15. See *Q. indica*.
 — *villosa.* See *Q. indica*.

Quivisia. (*Bois de Quivi*, of the natives of the Isle of France. Nat. ord., *Meliaceæ*. Allied to *Melia*.)

Stove evergreen tree. Cuttings of ripened shoots in sand, under a glass, and in a brisk bottom-heat; sandy loam and fibry peat. Winter temp., 48° to 55°; summer, 60° to 85°.
Q. heterophylla. 16. White. Mauritius. 1822.

R.

Raceme, a cluster. This is formed of numerous, rather distant flowers, each on its own stalk, but growing out of one central stalk, as in a bunch of currants.

Radish. *Raphanus sativus*.

Spring Varieties. — *Long rooted*:— Long White; called also the White Transparent, White Italian, and Naples Radish. White Russian. Twisted Radish of Mons. Semi-long Scarlet. Rose-coloured Semi-long. Scarlet, or Salmon, or Scarlet-transparent Radish. Purple, formerly called exclusively the Short-topped. Red-necked White and others of more or less merit.

Turnip-rooted:— White Turnip. Early White Turnip. Pink, Rose-coloured, Scarlet and Crimson Turnip. Purple Turnip. Yellow Turnip. New Yellow Short-topped.

Autumn and Winter Varieties. — These are all of the Turnip-rooted kind, and are in the order they follow in coming into use: — Yellow Turnip. Round Brown. White Spanish. Oblong Brown. Black Spanish. Large Purple. Winter or Purple Spanish.

The soil, a light loam, and moderately fertile, should be dug a full spade deep, and well pulverized. Manures should not be applied at the time of sowing. The situation should always be open, but for early and late crops warm and sheltered.

Sowing. — For the earliest productions, during December, January, and February, in a hotbed; and in the open ground once a month during winter, and every fortnight during the other seasons of the year.

In the open ground the seed is generally sown broadcast, and well raked in, but in drills is the more preferable mode. In either case it must be sown thin, and buried a quarter of an inch deep. Thick sowing causes the tops to be large, and the roots sticky.

If broadcast, the beds should be laid

out four or five feet wide, divided by alleys a foot in width, the earth from which may be thrown out to raise the beds. If drills are employed for the long-rooted, they are required to be three inches asunder, for the turnip-rooted four or five, and for the Spanish, etc., six or eight.

When the seedlings are well up, and advanced to five or six leaves, they are ready for thinning; the spindle-rooted to three inches apart, the turnip-rooted to four, and the larger varieties to six. The spaces, however, require to be rather increased in moist, warm weather. In dry weather they ought to be watered regularly every night. The early and late crops that have to withstand the attacks of frost, etc., should be kept constantly covered with dry straw or fern, to the depth of about two inches, or with matting, supported by hooping until the plants make their appearance, when the covering must be removed every mild day, but renewed towards evening, and constantly during frosty or tempestuous weather.

The bed should have a good watering the morning before that on which they are taken up, but none afterwards until subsequent to the drawing.

To draw for Salads whilst with their seed-leaves, sowings must be made once a week. The management is precisely that required for rape, mustard, etc.

To obtain Seed, leave in April, or early May, some of the most perfect plants of a main crop. When in full vigour, they must be taken up with as little injury as possible to the roots and leaves, and planted in rows, three feet asunder each way, being inserted by the dibble completely down to the leaves. Water must be applied until they have taken root, and occasionally throughout their growth, especially when in flower. If practicable, it is best to leave some plants where raised.

To obtain seeds of the Black Spanish, some seeds must be sown in March, or some of the winter-standing crop left or transplanted during that month. The pods must be cut as soon as they become of a brown hue, and well dried.

Two varieties must never be raised near each other, and seed of the previous year's raising should always be employed.

The seeds of the different varieties are easily distinguished by an experienced seedsman. Those of the long white radish are small, flat, and pale; of the scarlet and purple long-rooted, large; and of the first very light-coloured, com-

pared with those of the latter; of the white turnip, small, round, and brown; scarlet turnip, rather larger, and somewhat darker; purple turnip, larger and brown, being similar to the long-rooted purple, except in size.

Forcing.—A moderate hotbed is required for this crop, of a length according with that of the frame to be employed; the earth about eight inches deep, on the surface of which the seed is to be sown as soon as the violent heat is abated, and an additional fourth of an inch sifted over it.

The seedlings are in general up in less than a week, and in six they will be ready to draw. Throughout their growth air must be admitted as freely as is allowable. The glasses, however, must be closed on the approach of evening, and mats or other covering put on in proportion to the severity of the season. When the earth appears at all dry, a light watering must be given at noon.

The plants must not stand nearer than two inches to each other. The temperature required is from 50° to 70°; and it must be kept to this heat by moderate linings as required.

If there be a deficiency of frames, hoops and mats may be employed, a frame of boards being formed round the bed, light and air being admitted as freely and as often as possible. If seed is sown within a frame without any bottom-heat, the plants will be two or three weeks forwarder than if sown in the open ground.

Radish Fly. *Anthomyia florum*.

Rafnia. (Named after *C. Rafn*, a Danish botanist. Nat. ord., *Leguminosæ*; Tribe, *Genistææ*. Allied to *Hovea*.)

Greenhouse, yellow-flowered evergreens, from South Africa, except where otherwise mentioned. Seeds in a hotbed, in spring; cuttings of firm side-shoots at the beginning of summer, in sand, under a bell-glass; sandy peat and fibry loam, kept rough by pieces of charcoal and broken pots, and drainage well attended to. Winter temp., 40° to 48°.

Ragged Robin. *Lychnis Flos-cuculi*.

Rags. See Vegetable Manures.

Ragwort. *Oth'onna* and *Sen'e'cio Jacobæ'a.*

Railing is of various forms, but all, if made of wood, soon decay if slight, and are clumsy and inelegant if strong. Iron railing is at once light, neat, and enduring, and, like the following, may be erected for about 2s. per yard.

Raillia'rdia. (In honour of M. Raillhard. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

Greenhouse evergreen. For cultivation, see BEDFORDIA.

R. ciliola'ta. Yellow, crimson. Sandwich Islands. 1865. B. M. t. 5517.

Rain Berry. *Rha'mnus catha'r'ticus.*

Rain Tree. *Pithecolo'bium sa'man.*

Rainbow Flower. *I'ris.*

Raisin Tree, Japanese. *Hove'nia du'lcis.*

Raja'nia quina'ta. A synonym of *Akebia quinata.*

Rake. This implement is now much less in use than formerly, when broadcast sowing was prevalent. Now the broad hoe is quite as efficient in covering drill-sown seed. The head of the rake is best made of wood, and of this ash is most desirable. If the head be of iron, the teeth are continually becoming loose.

Rakes, with heads about six inches long, are required for dressing flower-borders, but for open ground-work the length may be fifteen inches. The hoe and the rake are sometimes attached to one handle; but it is a form liable to constant entanglement in the flower-garden, for which it is designed.

Ramo'ndia. (Named after L. Ramond, a French botanist. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreaæ*. Allied to *Streptocarpus*.)

Hardy herbaceous perennials. Seeds and divi-

sions in spring; sandy loam and a little peat; a sheltered place, or kept in a pit, in winter, as an alpine.

R. pyrena'ica. †. Purple. May. Pyrenees. 1731. Syn., *Verbascum Myconi.* B. M. t. 236.

— *se'r'vica.* Yellow. Thessaly. Syn., *Jankæa Heldreichii.*

Ramoon-tree. *Tro'phis.*

Rampion. *Phyteu'ma* and *Cy'phia phyteu'ma.*

Rampion. *Campa'nula rapu'nculus.*

The soil ought to be moderately moist; but it must be light. A shady, rich border is most favourable.

Sow during March, April, and May, in drills six inches apart; the plants from sowings in the first two months soon run up to seed. The plants are to remain where sown; though, in case of any deficiency, those which are taken away in thinning the crops may be transplanted successfully, if removed to a border similar to the seed-bed, and inserted with the roots perpendicular, and without pressing the mould too close about them. The best time for the removal is during the evening.

They are fit for thinning when about two inches in height, and they must be set at a distance of six inches apart. The plants of the sowings during the two first-mentioned months will be fit for use at the close of August, or early in September, and continue through the autumn. Those of the last one will continue good throughout the winter, and until the following April. The soil throughout their growth must be kept moist by giving frequent waterings.

The root, for which it is cultivated, either to be sliced together with its leaves in salads, or eaten as the radish, as well as to be boiled like asparagus, is most palatable when drawn young, and eaten fresh from the ground.

To obtain Seed, leave a few of the winter-standing plants. These flower in July and August, and ripen abundance of seed in early autumn. Gather it before it begins to scatter, and dry on a cloth before thrashing.

Ra'ndia. (Named after J. Rand, a London botanist. Nat. ord., *Rubiaceæ*;

Tribe, Gardeniæ. Allied to Gardenia.)

Stove evergreen shrubs, and white-flowered, except where otherwise mentioned. Cuttings of the young shoots in spring and summer, in sand, under a bell-glass, in a hotbed. Sandy, fibry loam and fibry peat, with a few nodules of charcoal. Temp., when at rest in winter, 45° to 50°; when growing in spring or summer, 80° to 80°.

Rantry, The Mountain Ash. *Pyrrhus aucuparia*.

Ranunculus. Crowfoot. (From *rana*, a frog; some of the species inhabiting marshy places. Nat. ord., *Ranunculacæ*; Tribe, *Ranunculeæ*.)

All yellow-flowered, except where otherwise specified. Annuals, seeds in common soil, in March and April, though few are worth the trouble, unless in a corner devoted to small native and alpine plants. Perennials, by division of the plant in spring. Aquatics, mostly natives, by division, and giving them any soil in shallow ponds or ditches; tuberous-rooted, by division of the roots in spring. *R. asiaticus*, the florists' *Ranunculus*, and its many varieties, may be planted in stiff, rich loam, either in October or March; if the former, the beds will require to be protected a little from heavy rains and from sharp frosts. See treatment as a florist's flower.

Ranunculus (*R. asiaticus*) as a Florist's Flower.

Varieties.—These are very numerous and annually increased.

Soil.—This should be of a fine texture, easily broken, and moderately light. It

should feel soft to the hand, and have a little sand amongst it. The best is generally found near to rivers. Let it be laid on a long heap, not too thick, and turned over once a month for a year. It will then be in good condition for use. Remove the old soil away from the bed you intend for ranunculuses to the depth, if the situation is dry, of fifteen inches: if wet, ten inches will do. Put in a layer of very rotten cow-dung, two inches thick; then bring the soil, put in a layer of four inches, upon that put a layer of rotten hotbed dung one inch thick, and so proceed till the bed is full, and raised two or three inches above the surface. Let the bed be edged with boards or slates. Hoop it over, to protect it from heavy rain, snows, and hailstones. Turn it over, mixing the materials together well, only take care not to disturb the layer of cow-dung at the bottom. Let this turning operation be performed two or three times at intervals of three or four weeks between, finishing the last about the end of January, so as to allow the bed to settle by the planting time in February.

Planting.—The best time for doing this is between the 8th and 20th of February. The soil of the bed ought to be neither wet nor dry. To prove its state, take up a handful, gently squeeze it, and let it fall about half a yard; if it is in a right condition, it will fall in pieces. With a rake level the soil; then, with a triangular-shaped and rather small hoe, or with the corner of a common hand-hoe, draw a drill across the bed, two inches deep; draw the next five inches distant from the first, and so on till the whole bed is finished. Commence this some fine morning, when there is a prospect of the day continuing fine. When the drills are all finished, sprinkle at the bottom of each drill some fine sand; then bring out your ranunculus roots, with a numbered label, made either of lead, with the number stamped upon it, or of wood, with each number written upon it with a blacklead-pencil upon a coating of white-lead. Begin then to plant the variety written in your book opposite No. 1; take each root between your finger and thumb, and place it at the bottom of the drill, very gently pressing it down in the sand to about half the length of the claws of each root. Having placed the first to your mind, put the next at four inches distance from it, and so proceed till you have planted all the first kind; then thrust in the numbered label, either with the number facing the kind, or with its back to it.

Both ways are practised by florists, but we prefer the number to face the variety it belongs to. If our plan is followed the number should be always put in first, the whole of the variety planted, and then the second number put in, and the second kind planted. Follow on in this manner till the bed is filled. As soon as that is completed, cover the roots just over the crowns with some more of the fine sand: this sand prevents the roots from getting too wet, or moulding. Then with a rake carefully level down the soil into the drills. If your bed is not edged with boards or slates (as recommended before), stretch a line on one side of the bed, about four inches from the roots, and with the back of the spade pat the soil on the side of the bed gently, to make it firm; then chop down the edge of the bed nearly perpendicularly.

After-culture.—It is essential to the success of this plant that the soil about it should be close and firm, almost approaching to hardness. If the bed has been rightly prepared, and the flower planted according to the instructions given, all will be well. When the tops begin to push through the soil, it will be of the greatest importance to tread the soil down very firm between the rows, and if any symptoms of cracking in the soil appear, the surface should be stirred to prevent it. Protection from sharp late frosts should be given, by covering whenever such weather is likely to take place, and it is equally beneficial to protect from heavy rains. Both are best excluded by hoops extended across the bed to support a covering of tarpaulin or oil-cloth. During April and May, should dry weather prevail, water may be cautiously administered at intervals in an evening, but only just so much as will prevent the soil of the bed from cracking; or a little moss or old, spent tanners' bark, etc., may be neatly placed between the rows, which will retain the moisture in the soil. The over-abundant application of water is a very common error, and one of the greatest evils.

The dying of leaves, in some instances, evidently depends on a want of vigour, or partial rot in the root; and, in some few cases, it would appear to be caused by large earthworms, forming their wide tracks amid the roots of the plants, nearly undermining them; but in the great majority of cases it is produced by injudicious watering.

During the expansion of the flower-buds, and when they are fully blown, an awning should be erected over the bed, as in the case of tulips, that rain and

hot sun may be excluded; and gentle watering every second or third evening may be given, which will keep the bed cool and moist, and promote the size of the flower. As much air should be admitted as possible, that the flower-stems be not drawn and weakened.

Raising Seedlings.—Save seed only from varieties distinguished for excellence of form and colour. Sow in February, and place the boxes in a cool greenhouse or frame. Sow in boxes eighteen inches by eleven inches and four inches deep, full of loamy earth, and the surface level. Sow the seeds about the eighth of an inch apart; cover them as thinly as possible, and water with a fine rose; but place the boxes under glass, without heat. The plants usually make their appearance in about a month. Give air day and night, except in severe frost; then cover up with straw mats. With such protection, the young plants will endure the severest seasons. Put the boxes in the open ground up to the second week in May, and water daily until the leaves begin to wither; then suffer the boxes to become quite dry; and in the middle of July take them up, and preserve the roots in bags until February, and then plant them as the general stock. In the following June they flower.

Taking up.—The roots, in wet seasons, should be taken up as soon as the leaves turn yellow, as they are apt to sprout; but in dry seasons they may remain until the leaves are brown. Take them up as dry as the season will permit; complete the drying in a warm room, rather than in the sun, and store them in a dry, cool place.

Forcing.—Select tubers which have been kept three or four months, or even a year over the season of planting, these being more easily excited than those which have been only the usual time out of the soil; plant them in pots about the beginning of August; and, by bringing these into the greenhouse at different periods, a bloom is kept up from October to February.

Rapate'a pandanoides. See *Saxofredericia subcordata*.

Rape, or Coleseed (*Bra'ssica napus*). Like mustard and other small salading, it may be sown at any period of the year, when in request, being allowed a separate bed. It is cultivated as **Mustard**, which see.

To obtain Seed.—Some plants of a sowing made about the middle of July must be thinned to eighteen inches apart:

they will survive the winter, and flower in the May and June of the next year. The seed, which is produced in great abundance, ripens in July and August, and must be cut as it does so, and laid upon cloths to dry.

Rape (edible-rooted); This name may be applied to a variety of the rape mentioned by Mr. Dickson, formerly one of the vice-presidents of the Horticultural Society. Its root is white and carrot-shaped, about the size of the middle finger. It is much more delicate in flavour than the turnip, like which root it is cooked, only that it is not peeled, but scraped, its skin being remarkably thin.

Sowing.—For the main crop, sow from the middle of July to the end of August, or even later. These will supply the table until April; and if wanted throughout the year, a little may be sown in the latter end of October, the plants from which will be fit for use during April and May; the last crop to be sown from the middle of January to the middle of February, which will come in at the end of May and during June. On a north border, and if the soil is sandy and moist, it is possible to have them sweet and tender during the whole summer, to effect which sow at the close of March and May.

Cultivation.—Thin and hoe as turnips. In dry weather the beds must be watered regularly.

Soil.—One great advantage attending the cultivation of this vegetable is, that it requires no manure. Any soil that is poor and light, especially if sandy, is suitable to it. In rich, manured soil it grows much larger, but not so sweet and good.

To obtain Seed.—In February or March, some of the finest roots are transplanted to two feet asunder; but it would, perhaps, be a better practice to leave them where grown. The seed must be cut as soon as ripe, and treated as directed for turnips, etc.

Ra'phanus. Radish. (From *ra*, quickly, and *phainomai*, to appear; rapid germination of the seeds. Nat. ord., *Cruciferae*; Tribe, *Raphanaceae*.)

Hardy annuals. Seeds; rich, sandy soil; but for standing the winter it should be dry and poor. See RADISH.

R. arcuatus. See *Chorispora tenella*, var. *arcuata*.

— *caudatus*. 1½. White, purple. July. Java. 1815.

— *isatoides*. Yellow. Garden variety. 1886. Rev. Hort. 1886, p. 372, fig. 101.

R. sativus. 3. White, purple. May. China. 1648.

— *tenellus*. See *Chorispora tenella*.

Raphia. (Probably from the native name of the West African species. Nat. ord., *Palmeae*; Tribe, *Lepidocarpaceae*.)

Stove palms. See COCOS.

R. Rufia. 60. Madagascar.

— *tedd'gera*. Posa. 1847.

— *vinifera*. W. Africa.

Raphido'phora. (From *raphis*, a needle, and *phero*, to bear; on account of the needle-like hairs, which abound in the intercellular spaces in all parts of the plants. Nat. ord., *Aroidae*; Tribe, *Callae*. Allied to *Monstera*.)

Stove climbing evergreen perennials. Seeds; cuttings in sandy loam and peat in bottom-heat and under a band-glass. Rich loam and fibrous peat, about half and half. They do best when planted in a border, and allowed to climb up the dead stem of a tree or a wall. Moist atmosphere. Summer temp., 70° to 90°; winter, 65° to 75°.

R. decursiva. Yellowish. India. 1859.

— *lancifolia*. Spathe apricot colour, green-spotted; spadix white. India. 1874.

— *Pee'pla*. Yellow. E. Indies.

— *pertusis*. E. Indies.

Raphiole'pis. Indian Hawthorn. (From *raphis*, a needle, and *lepis*, a scale; formation of the bracts. Nat. ord., *Rosaceae*; Tribe, *Pomeae*. Allied to *Cratægus*.)

Half-hardy, white-flowered, evergreen shrubs from China. Cuttings of half-ripened shoots in sandy loam, in a sheltered place, under a band-light; sandy loam and peat; a sheltered place against a wall, or protected in very cold places by a cold pit; most of them have stood at least several seasons protected by a wall in the vicinity of London.

Raphiste'mma. (From *raphis*, a needle, and *stemma*, a crown. Nat. ord., *Asclepiadaceae*; Tribe, *Cynancheae*.)

A stove climber. For cultivation, see STEPHANOTIS.

R. cilium. B. M. t. 5704. See *Dæmia extensa*.

— *pulchellum*. White, pink. July. E. Indies. 1852. Paxt. Mag. xiv. p. 27.

Raspai'lia. (Named after *M. Raspail*, a French botanist. Nat. ord., *Bruniaceae*. Allied to *Brunia*.)

Greenhouse evergreen. Cuttings of young, stubby shoots in sand, under a bell-glass, and in a cold frame; sandy, fibry peat. Winter temp., 40° to 48°.

R. microphylla. 1. White. July. Cape of Good Hope. 1804. A synonym of *BERARDIA MICROPHYLLA*.

Raspberry. *Rubus idæus.*

Varieties.—The most useful are as follows:—1. Red Antwerp; 2. Yellow Antwerp; 3. Fastolf, or Filby; 4. Double-bearing. Of these, Nos. 1 and 2 have been for many years highly esteemed; but 3 has, of late, in a great degree, superseded them, being larger and of at least equal flavour, a great bearer, and possessing that desirable property in the summer Raspberries of producing occasionally fine autumnal fruit, which is superior to that of the double-bearing kinds. No. 4 is a decided autumn Raspberry. Mr. Rivers, of Sawbridgeworth, has a new variety of this from America, which is said to be very superior. Another variety is a hybrid between the Raspberry and Blackberry; this Mr. Rivers calls "the Black," and states is good for preserving.

Propagation: by Suckers.—Those who desire to make a new plantation of Raspberries will do well to obtain their suckers from a healthy stock. We have known new plantations made in cases of emergency from a stock which had stood too long in the ground, and of course were lean, if not diseased. This leanness was evidently transmitted to their progeny, and, despite high manuring, a year or two was lost before they could recover. Suckers, then, may be planted any time between October and the middle of February, and they are drawn away from the old plants by hand; a slight pull will soon show which are those disposed to colonize. Deeply-dug ground is requisite, and it should have a liberal amount of half-rotten manure. Strong suckers (drawn with a ball of soil, if possible) may be planted three in a group, at the end of September, four feet apart from centre to centre; and the rows, if side by side, six feet apart. As soon as the leaf drops, say the beginning of November, we would prune one strong cane to three feet, a second to two feet, and a third to within a couple or three inches of the soil. By these means a nice little crop may be taken the first year, and good shoots reserved for the next.

From Seed.—This is practised chiefly with a view of raising new kinds; and the seed collected from superior berries, when thoroughly ripe, is washed from the pulp and dried, then packed in papers until spring. In the beginning of February it must be sown, and a gentle hot-bed would hurry the process much. The seedlings must be pricked out when three inches high, and generous treatment must be continued; and towards the middle of May, having been hardened

off, they may be planted at once in their final destination. All that is requisite now is careful training, the keeping down suckers and watery spray; and when the shoots are five feet long, the top may be pinched to consolidate the wood.

Soil.—When wild, being an inhabitant of woods, a damp soil, somewhat retentive of moisture, is found to suit it best. We have generally known it most successful in a darkish soil of an alluvial character; any of our loams, however, of sound texture, will grow it in perfection, but the soil should be tolerably deep. A hot and loose sand, short of depth, is the least suitable. To meet the increased amount of transpiration from the leaf to which the cultivated plant is liable in sunny situations, extra provision in the way of top-dressing and mulching is highly to be commended.

Culture during the Growing Period.—Soon after the canes begin to shoot in spring, a slight thinning-out is very beneficial; this may take place about the beginning of May. In a few weeks' time a thinning of the suckers may take place, for, in general, they produce a profusion, and such draw on the resources of the plant, and exhaust the soil. About four or five may be left on each stool; if they are very gross, the moderate ones may be left; if weak, the strongest.

If they have not been mulched, it should be done immediately. As soon as the last fruit is gathered, the old bearing shoots may be cut clean away, and the young canes drawn a little closer together. When over five feet in height, the tops may be pinched; this, however, should not be done before the end of August.

Culture during the Rest Period.—As soon as the leaves have all fallen, pruning may take place, and our practice is to leave four canes. These we cut at different heights; the tallest about four feet; the next about nine inches lower, and so on with the rest. By these means the young spray is nicely divided, and the plants fruit from bottom to top. The canes are now neatly fastened, and a top-dressing completes the rest period. All useless suckers or canes are drawn away.

Training.—The earliest and finest are obtained from canes planted beneath a south wall, and trained against it in this form. But in the open ground the best mode of train-

ing is round small hoops, thus. The worst form is plaiting the canes together; and training in arches, or other compact forms, excluding the light and warmth of the sun, is little better.

Forcing. — Raspberries may be forced, growing either in pots or in the borders of the house. They may be also planted on the outside of a pit, the bearing canes being introduced inside it, and trained to a trellis, whilst the present year's shoots are left outside.

Raspberry Moth. *Lampro'nia rubie'lla*. The larva of this pretty little moth sometimes plays sad havoc in Raspberry beds, by feeding upon the buds and thereby destroying the crop of fruit. The caterpillar is about one-third of an inch in length, of a scarlet colour, with a black head marked with pale lines. When first hatched from the egg, which takes place in August, it feeds upon the foliage for a time, and then crawls to some place of concealment and hibernates. In the spring it comes out again, and commences to attack the young flowering shoots, feeding inside the flowering buds, and finally destroying the inside tissue of the young shoot. When full fed, it spins a cocoon among the withered leaves, and there changes to a brown chrysalis, from which the moth emerges in the course of two or three weeks.

The moth is about half an inch in expanse: the fore wings are shining brown, with five or six golden spots along the front margin of each, and two larger ones on the inner margin, with a few smaller ones on the middle part of the wing; the hind wings are dark brown.

The best method of getting rid of this insect is to hand-pick and destroy the attacked shoots in the early part of June. If this be done thoroughly, although the year's crop will be destroyed, yet that for the following year will probably be saved. The attacked shoots may be known by their withered, unhealthy appearance.

Rattlesnake Fern. *Botry'chium virg'nicum*.

Rauwo'fia. (Named after *L. Rauwolf*, *M.D.*, a botanical traveller. Nat. ord., *Apocynaceæ*; Tribe, *Plumierieæ*. Allied to *Carissa*.)

Stove evergreen shrubs. Cuttings of the points of shoots, or stubby side-shoots, in sand, under a bell-glass, in the beginning of summer, and in bottom-heat; sandy, fibry loam, fibry peat, a little dried leaf-mould, and pieces of charcoal. Winter temp., 50° to 60°; summer, 60° to 88°.

Rendle's Tank System of heating was first suggested, we believe, by Mr. Rendle, nurseryman, of Plymouth. A tank of iron or wood, twenty feet long, five feet broad, and six inches deep, is constructed in the centre of the house, and surrounded by a walk, except at the end, where the boiler is fixed for heating it. The top of the tank is covered with large slabs of slate, cemented together, to prevent the excessive escape of steam. Around this is a frame sufficiently high to retain the bark, in which the pots are plunged. The boiler and tank are filled with water, and this circulates, when the fire is lighted under the former, by

means of two pipes, one from the top of the boiler, and the other returning nearer to its bottom. The expense of pipes, and the danger of their freezing, are avoided; the fire only requires to be kept lighted for two hours at night, and again for the same period in the morning; the water, when once heated, retaining its temperature for a long time. In a small house, the apparatus can be constructed for £5, and in all for less than half the cost of hot-water pipes. The saving in tan and labour is also very great. In some places tan costs 19s. per cart-load, and where it is cheaper, the trouble and litter incident to its employment, and the dangers of loss from fungi and insects, of which it is the peculiarly fertile foster-parent, render it objectionable as a source of heat; and whenever the tan has to be renewed, the trouble and destruction of plants are always great.

"In my new propagating house," says Mr. Rendle, "the tank or cistern is placed in the centre, with a walk surrounding it, so as to enable the propagator with greater ease to attend to the plants, etc.

"On the outside of the house is a fire-shed, in which the boiler is fixed. The tank, made of wood, one and a half or two inches thick, which I find the cheapest material (it also prevents the water cooling so fast as it does either in stone or iron), may be lined with lead or zinc. Exactly in the centre of the tank is a partition, serving the double purpose of causing the water to circulate, as well as to support the edges of the slates, an aperture being left in the partition, of about two inches in breadth, to allow the water a free passage. The flow-pipe enters near the appendage of the tank, at the mouth of which pipe a piece of perforated copper is placed, as also at the return-pipe, to prevent dirt and sediment from finding their way into the boiler. After everything is properly fixed, the tank is filled with water, which, of course, at the same time fills the boiler. . . . The tank is about four inches deep. Across it, and resting on its sides, are placed slate stones about an inch and a half thick, cut square at the edges. These are fastened to each other by Roman cement, or Aberthaw lime, to prevent a superfluity of steam from escaping into the house. . . . Around the edges of the slates a piece of inch board, about nine inches deep, should be placed to inclose the sawdust, sand, moss, or other plunging material."

In the following sketch, for which, as

well as for the next, we are indebted to Mr. Rendle, *A* is a transverse section of Roger's conical boiler; *B* is the fireplace; *g*, the tank; *c*, the flow-pipe; *d*, the pipe by which the water returns to the boiler; *e*, is the hole for the smoke, which, joined to a flue, *f*, can be made either to ascend the chimney at once, or to pass round the house.

The next sketch is a Pinery, fitted up with Mr. Rendle's tank.

It is described as "a very useful and most desirable structure for the growth of the Pine Apple, with a hollow wall, recommended by all garden architects in preference to a solid wall—the heat or cold being not so readily conducted as through a solid mass of masonry." Mr. Rendle might have added, that hollow walls are also much drier.—*Rendle's Treatise on the Tank System.* See **Stove** and **Hotbed**.

Renea'lmia. (In honour of *Paul Renealme*, a French botanist and author of a "History of Plants," 1611. Nat. ord., *Scitamineæ*; Tribe, *Zingiberæ*.)

Stove, herbaceous perennials. For culture, see **ALPINIA**.

R. exalta'ta. 8. Scarlet. July. West Indies. 1820. Syn., *Alpinia tubulata.* B. M. t. 2494.

— *jamaice'nsis.* 6. White. July. Jamaica. 1793. Syn., *Alpinia occidentalis.*

— *nutans.* Andr. Rep. t. 360. See *Alpinia nutans*.

Renea'lmia of R. Brown. (Nat. ord., *Irideæ*; Tribe, *Sisyrrinchieæ*.) A synonym of **Libertia**.

R. grandifl'ora. Swt. Fl. Gard. t. 64. A synonym of *Libertia grandiflora*.

— *panicula'ta.* A synonym of *Libertia grandiflora*.

— *pulche'lla.* A synonym of *Libertia pulchella*.

Requie'nia. (Named after M. Requin, a French botanist. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.) See **Tephrosia.**

Stove evergreen shrubs, with yellow flowers. Cuttings of half-ripened, stubby shoots in sand, under a bell-glass, in heat; sandy loam, fibry peat, and dried leaf-mould. Winter temp., 50° to 60°; summer, 60° to 80°.

— *obcordata*. See *Tephrosia obcordata*.
— *sphaerosperma*. See *Tephrosia sphaerosperma*.

Rese'da. Mignonette. (From *resedo*, to calm; supposed virtue for external bruises. Nat. ord., *Resedaceæ*.)

All by seeds; the half-shrubby kinds also by cuttings; seeds must be sown at different times, according as the bloom is wanted. The beginning and middle of May is early enough to sow in the open border. Though usually treated as annuals, most of the Mignonettes may be grown as under-shrubs or perennials, if they are prevented seeding freely, and kept from frost in winter. We have seen the common Mignonette that had been kept in a pot about eight years, and flowered freely every season. See MIGNONETTE.

R. chinensis. 2. Yellow, green. June. China. 1819.
— *odora'ta*. 1. Green, red. August. Italy. 1762. B. M. t. 29. Sweet-scented Mignonette.
— — *frutescens*. 2. August. Egypt. 1752. B. R. t. 227.
— — *pyramidalis grandiflora*. Garden variety. 1884.
— *trunca'ta*. 1½. Yellow. June. Natolia. 1836.

Reserve Garden. See **Nursery.**

Rest. That period when a plant is not growing.

Rest-Harrow. *Ono'nis*.

Restio. (From *restis*, a cord; cords are made from these plants in South Africa. Nat. ord., *Restiaceæ*.)

A genus of grass-like greenhouse plants of no great cultural value.

R. subverticillatus. 3. Brownish. South Africa. Syn., *Willdenovia teres* of Gardens.

Restrepia. (Dedicated to M. Restrepa. Nat. ord., *Orchideæ*; Tribe, *Epidendreae*—*Pleurothalleæ*.)

Stove epiphytes. Allied to *PLEUROTHALLIS*, and requiring the same treatment.

R. antennifera. Yellow, red-purple. Columbia. 1869.
— *Dayana*. Violet-brown, yellow. Costa Rica. 1875.
— *elegans*. ½. Yellow, purple. Caraccas. 1872.
— *Falkenbergii*. Yellow, white, purple. Columbia. 1880.
— *Lansbergii*. B. M. t. 5257. See *R. xanthophthalma*.
— *maculata*. Yellow, blackish. Columbia. 1875.
— *ophiocephala*. Yellow. April. Mexico. 1837. Syn., *Pleurothallis ophiocephala*.
— *pandurata*. Whitish, purple, crimson-purple. Columbia. 1887.
— *prorepens*. Yellow. Costa Rica. 1877.
— *Reichenbachiana*. ¾. Yellow, dark purple. Costa Rica. 1875.

R. striata. Sepals striped, not spotted as in the other species. G. C. 1891, ix. p. 137.

— *xanthophthalma*. Yellow, spotted with purple. Guatemala. 1861. Syn., *R. Lansbergii*. B. M. t. 5257.

Resurrection Plant. *Anastatica Hierochthalia*, *Mesembryanthemum Tripolium* and *Selaginella lepidophylla*.

Retani'la. (The Peruvian name. Nat. ord., *Rhamnaceæ*; Tribe, *Colletieæ*.) See **Colletia.**

R. Ephedra. See *Colletia Ephedra*.
— *obcordata*. See *Colletia obcordata*.

Retarding requires as much skill as forcing, for as the latter requires the application of all that is suitable to the promotion of a plant's rapid healthy growth, so retarding requires the withholding from it of those contingencies. Thus to retard growth, the lowest temperature, and the least degree of light compatible with healthy growth, must be secured; and to this end plants for succession are often placed on the north side of a wall. See **Screens.**

Then, again, as in the case of raspberries and strawberries, plants are often cut down in the spring, compelling them to form fresh foliage and stems, and thus be productive in the autumn instead of the summer.

The vegetation of many bulbs may be prevented by merely keeping them dry, and, indeed, the withholding the usual supply of water, giving it only in diminished quantities, is necessary in all retarding treatment. To secure the entire resting of bulbs, and of such plants as will bear so low a temperature, the atmosphere of the ice-house is effectual; and to this end it should have a few shelves for the support of boxes or flower-pots. Banks of earth ranging east and west, and facing the north at a very acute angle, are very useful in retarding the early advance to seed in hot weather of spinach, lettuces, etc. Espaliers ranging similarly, and shaded during the whole of March and the two following months, will blossom later and more unfailingly than trees more exposed to the sun in spring. Similar exclusion of heat and light retards the ripening of picked fruit, and if the air be excluded from them, or its oxygen withdrawn, fruit will remain unripened for weeks. To effect this, put a paste formed of lime, sulphate of iron, and water, at the bottom of a wide-mouthed glass-bottle, then a layer of large pebbles to keep the fruit from the paste, then fill the bottle with peaches, apricots, or plums, gathered a few days before they are ripe, cork the bottle

tight, and cover the cork with melted resin. They have been thus kept for a month, and summer apples and pears for three months. They ripen when again exposed to the air.

Reti'nia turiona'na. See Pine-bud Moth.

Retiniphy'llum. (From *retine*, resin, and *phyllon*, a leaf. Nat. ord., *Rubiaceæ*; Tribe, *Retiniphyllæ*. Allied to *Hamiltonia*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a sweet, moist bottom-heat; sandy loam and fibry peat, with pieces of charcoal. Winter temp., 55° to 60°; summer, 60° to 85°.

R. secundifo'rum. 10. White. Brazil. 1839.

Retino'spora. (From *retine*, resin, and *sporos*, seed. Nat. ord., *Coniferæ*; Tribe, *Cupressineæ*.)

Hardy evergreens, requiring the same culture as *CUPRESSUS*. Sometimes this genus is united with *CHAMÆCYPARIS*.

R. du'bia. Syn., *Chamæcyparis dubia*.

— *Eltwangeria'na.* Syn., *Chamæcyparis Eltwangeriana*.

— *juniperoid'es.* Syn., *Chamæcyparis juniperoides*.

— *leptocla'da.* 10. Japan. Syn., *Chamæcyparis leptoclada*.

— *obtu'sa.* 80. Japan. Syn., *Chamæcyparis obtusa*.

— *lycopodioid'es.* Japan. 1861. Syn., *Chamæcyparis obtusa*, var., *lycopodioides*.

— *Tronbetzkoia'na.* Garden variety. 1890.

— *variega'ta.* Twigs variegated. Japan. 1871. Syn., *Chamæcyparis obtusa*, var., *variegata*.

— *plumo'sa.*

— *squarro'sa.* 6. Japan. Syn., *Chamæcyparis squarrosa*.

Rham'nus. Buckthorn. (From *rham*, a Celtic word, signifying a tuft of branches. Nat. ord., *Rhamnaceæ*; Tribe, *Rhamnææ*.)

Greenhouse and stove species, by cuttings in sand, under a glass, in summer, and in a cold or close, warm pit respectively; sandy loam and leaf-mould. Hardy species, by seeds, layers, and cuttings, and more especially the latter mode with all the evergreens, which should be taken off in the autumn, and inserted in sandy soil, in a shady border, with hand-lights over them; good garden-soil.

GREENHOUSE EVERGREEN SHRUBS.

R. amygdali'nus. 3. Yellow. June. N. Africa.

— *celtifo'rius.* 20. Green, yellow. May. Cape of Good Hope.

— *chloro'phorus.* China. 1857. Green dye of China.

— *Wicklius.* 6. 1839.

Rhaphido'phora. See **Raphido-phora.**

Rhaphidophy'llum. (From *Rhaphis*, and *phyllon*, leaf. Nat. ord., *Palmeæ*.)

Greenhouse palm. For culture, see CHAMÆROPS.

R. hystrix. 4. Yellow. June. S. United States. 1801. Syn., *Chamærops hystrix*.

Rhaphiole'pis. See **Raphiole-pis.**

Rhaphitha'mnus. (From *rhapis*, a needle, and *thamnos*, a shrub; some of the species are spiny. Nat. ord., *Verbenaceæ*.)

A greenhouse tree, but hardy in the south-west of England. Culture, same as for MYRTUS. *R. cyanocarpus*. 20. Lilac; berries bright blue. Summer. Chili. B. M. t. 6849.

Rhapidospo'ra. (From *rhapis*, a needle, and *sporos*, a seed. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.)

Stove herbaceous perennials, from the East Indies. For culture, see JUSTICIA.

R. glabra. Rose, yellow. June. 1824. Wight, Ic. t. 1554. A synonym of *Justicia glabra*.

— *vestita*. Violet. June. 1827. A synonym of *Nelsonia tomentosa*.

Rha'pis. (From *rhapis*, a needle; the sharp-pointed leaves. Nat. ord., *Palmeæ*; Tribe, *Coryphææ*. Allied to *Chamærops*.)

Greenhouse palms. Suckers generally, and by division at the roots; rich, sandy loam; most require the protection of the greenhouse; but some will probably succeed in warm situations out of doors.

R. acutis. See *Sabal Adansoni*.

— *arundinacea*. A synonym of *Sorghum halepense*. (Nat. ord., *Gramineæ*.)

— *aspera*. A synonym of *R. flabelliformis*.

— *cochinchinensis*. 8. Cochinchina.

— *cordata*. Green. May. South France.

— *flabelliformis*. 6. Green. August. China. 1774. B. M. t. 1371; Jacq. Schoenb. iii., t. 316.

— *variegatus*. Leaves striped. Japan. 1861.

— *humilis*. Japan. 1837. Syn., *R. Sirotsik*.

— *java'nica*. Java.

— *Kwamwo'nzick*. 5. Japan?

— *major*. Said to be the largest of the genus. 1889.

— *Siro'tsik*. See *R. humilis*.

Rhapo'nticum. (From *rha*, rhu-barb, and *Ponticus*, Pontus. Nat. ord., *Compositæ*; Tribe, *Cynaroideæ*.) A synonym of **Centaurea**.

R. acutis. See *Centaurea acutis*.

— *Palla'sii*. See *Centaurea Rhapontica*.

— *pulchrum*. See *Centaurea pulchra*.

— *scariosum*. See *Centaurea Rhapontica*.

— *uniflorum*. See *Centaurea monanthos*.

Rha'zya. (From the Arabic name. Nat. ord., *Apocynææ*.)

Hardy perennial, resembling a Vinca. For culture, see VINCA.

R. orientalis. Bright blue to dark violet. Taurus. 1889.

Rhee'dia. (Named after *Rheede*, author of the *Hortus Malabaricus*. Nat. ord., *Guttiferæ*; Tribe, *Garcinieæ*.)

Stove evergreen. Cuttings of shoots, rather ripe, in sand, under a bell-glass, and in a moist bottom-heat; sandy loam and fibry peat. Winter temp., 60° to 55°; summer, 80° to 85°.

R. java'nica. Java. 1826.

Rhe'um. Rhubarb. (From *Rha*, the Russian name of the river Wolga, near which the Rhubarb was found. Nat. ord., *Polygonaceæ*; Tribe, *Rumiceæ*.)

Hardy herbaceous perennials. Seeds in spring, and division of the plant then, just as the buds begin to swell; deep, rich, loamy soil. See RHUBARB.

R. acuminatum. 3. Purple. Sikkim. 1851.

— B. M. t. 4877.

— *australe*. See *R. Emodi*.

— *austricum*. 5. White. May. Austria. 1800.

— *caespitum*. 6. White. May. Russia. 1817.

— *compactum*. 8. White, green. May. Tartary.

— *crispum*. 5. White. May. 1800.

— *Emodi*. 10. White. Himalaya. B. M.

— t. 3508. Syn., *R. australe*.

— *fenestratum*. 6. White. May. 1780.

— *hybridum*. 5. White, green. May. Asia. 1778.

— *leucorhizum*. Striped. May. Siberia. 1827.

— *no'bile*. 4. Sikkim. 1876. Fl. Ser. t. 1272.

— *nutans*. See *R. compactum*.

— *officinale*. 8. Greenish. Tibet. 1871.

— *palmatum*. 5. White, green. June. Bucharia. 1763.

— *tanguticum*. Green. N. W. China. 1875.

— *Rhaponticum*. 4. White, green. May. Siberia. 1573.

— *ri'bes*. 2. White, green. May. Levant. 1724.

— *sibiricum*. 6. White. May. Siberia. 1800.

— *tataricum*. 3. White, green. May. Tartary.

— 1793.

— *undulatum*. 4. White, green. May. China. 1734.

Rhe'xia. (From *rhexis*, a rupture; supposed cure for ruptures. Nat. ord., *Melastomaceæ*; Tribe, *Rhezieæ*.)

Hardy herbaceous North American plants, blooming in July. Division and cuttings under a hand-light; peat and loam. Most of the perennials will succeed in a peat border.

R. Acisanthera. A synonym of *Acisanthera quadrata*.

— *angustifolia*. 1. White. 1812.

— *chiosa*. 1. Purple. 1812.

— *glomerata*. B. C. t. 334. A synonym of

Pterolepis glomerata.

— *holosericea*. B. C. t. 236. A synonym of

Pleroma holosericeum.

— *mariana*. 1. Purple. 1759. B. C. t. 386.

— *rubella*. 2. Pink. 1823. Swt. Fl. Gard., t. 41.

— *viminæa*. B. R. t. 664. A synonym of *Pleroma viminæum*.

— *virginica*. 2. Purple. 1759. B. M. t. 968.

Rhinaca'nthus. (From *rhis*, a nose, and *Acanthus*; the shape of the corolla is similar to that of *Acanthus*. Nat. ord., *Acanthaceæ*.)

Stove shrubs. For culture, see JUSTICIA.

R. communis. 2. White. June. East Indies. 1790. Syn., *Justicia nasuta*, B. M. t. 525. Ringworm Root.

Rhinanthus. (From *rhis*, a nose, and *anthos*, flower; in allusion to the shape of the flower. Nat. ord., *Scrophulariaceae*.)

Hardy annuals, parasitic on the roots of grass, in moist places. Propagated by seeds.

R. Crista-galli. 1. Yellow. Summer. Britain. Syn., *R. minor*, Eng. Bot. ed. 3, t. 998. — *major*. 1. Orange yellow. Late summer. Britain. Eng. Bot. ed. 3, t. 999.

Rhinchoglossum. (From *rhynchos*, a beak, and *glossa*, a tongue; form of the lip of the flower. Nat. ord., *Gesneraceae*; Tribe, *Cyrtandreae*. Allied to *Didymocarpus*.)

Greenhouse biennial. Seeds in hotbed, in spring, and, after being potted off, flowered in the plant stove or greenhouse; peat and loam, with a little silver sand and leaf-mould.

R. obliquum. 1. Blue. July. Ceylon. 1844. Syn., *R. zeylanicum*, B. M. t. 4193.

Rhinopetalum. (From *rhis*, a nose, and *petalon*, a petal; base of the upper sepal. Nat. ord., *Liliaceae*; Tribe, *Tulipeae*.) A synonym of **Fritillaria**.

R. Karelini. Swt. Fl. Gard. ser. 2, t. 283. See *Fritillaria Karelini*.

Rhipidopteris. (From *rhipis*, a fan, and *pteris*, a fern; formation of the fronds. Nat. ord., *Filices*—*Polypodiaceae*.) A section of **Acrostichum**.

Stove, brownish-yellow-spored ferns. See **FERNS**.

R. bifurcata. March. W. Indies. — *jaeniculacea*. March. W. Indies. — *peltata*. March. S. America. — *tripartita*. March. Brazil.

Rhipsalis. (From *rhips*, a willow-branch; referring to the flexible branches. Nat. ord., *Cactaceae*; Tribe, *Opuntieae*.)

Greenhouse succulents. Cuttings, dried at the base for a few days before inserting in rough gravel or brick-rubbish; sandy loam, brick-rubbish, and leaf-mould. Winter temp., 40° to 55°; summer, 60° to 85°.

R. brachicata. See *R. Saglionis*. — *Cassytha*. 1. Yellow. September. W. Ind. 1758. Syn., *R. Hookeriana*. — *communis*. Rose, white. Summer and autumn. Brazil. 1836. Syn., *Lepismium commune*, B. M. t. 3765. — *crispata*. 1. White. December. — *dissemitis*. S. Brazil. 1890. Gf. 1891, p. 634, fig. 121. Syn., *Lepismium dissimile*. — *fasciculata*. Dull yellow. W. Indies. B. — *Sagliónis*. 1. Greenish-yellow. March. Buenos Ayres. 1843. Syn., *R. brachiatata*. B. M. t. 4039.

— *salicornioides*. Yellow. Spring. Brazil. B. M. t. 2461.

— *sarmentacea*. White. Brazil. 1858. B. M. t. 5136.

— *spathulata*. Yellow. July. Brazil. 1836. — *Swartziana*. White. June. Jamaica. 1810.

— *trigonata*. Brazil.

Rhizophora. Mangrove. (From *rhiza*, a root, and *phoreo*, to bear; the branches send down roots like the Banyan-tree. Nat. ord., *Rhizophoreae*.)

Not likely to be much cultivated until we obtain salt water aquariums in our large tropical houses. The Mangrove flourishes in rich, loamy soil, in thickets, by the side of the ocean, in tropical latitudes, and possesses the striking feature that the seeds vegetate while attached to the plant, and send out a long radicle, which generally reaches the soft mud, while the top puts out leaves; numbers of plants are thus joined together, something in the same way as the Banyan-tree.

R. Mangie. 10. Pale yellow. E. Indies. 1820.

Rhodamnia. (From *rhodamnus*, a small branch; referring to the size of the plants. Nat. ord., *Myrtaceae*.)

The only species introduced is a greenhouse shrub, or small tree, requiring the same culture as MYRTUS.

R. trinervia. White. May. Australia. 1823. Syn., *Eugenia trinervia*. B. M. t. 3223.

Rhodanthe. (From *rhodon*, a rose, and *anthos*, a flower. Nat. ord., *Compositae*; Tribe, *Inuloideae*.) This genus should have been included in **Helipterum**.

Greenhouse annuals. Seeds, sown in September, in a hotbed; and also in March, for plants to bloom in spring and summer; sandy loam, and leaf-mould, and fibry peat, to sow and prick off in; as the plants are put in their flowering pots, usedried, rotten cow-dung and silver sand freely. After the first potting, an airy place in the greenhouse.

R. atrosanguinea. Pink, crimson. W. Australia. 1861. Half-hardy annual. B. M. t. 5283.

— *maculata*. Pink, crimson. N. W. Australia. Half-hardy annual. There is a white-flowered variety. These two are perhaps only varieties of *R. Manglesi*.

— *Mangle'ii*. 1½. Rose, yellow. June. Swan River. 1832. B. R. t. 1708; B. M. t. 3483; B. M. t. 5290. A synonym of **HELIPTERUM MANOLESI**.

Rhoddon, or **Roddon-tree**. *Pyrrus Aucupa'ria*.

Rhodiola. A synonym of *Sedum*.

Rhodochiton. (From *rhodo*, red, and *chiton*, a cloak; the calyx is swollen and red. Nat. ord., *Scrophulariaceae*; Tribe, *Antirrhineae*.)

A showy greenhouse climber. Propagated by seeds, sown in a slight hotbed in spring; also by cuttings in August, under a hand-glass.

R. volubile. 10. Calyx red; corolla deep blood-colour. June. Mexico. 1833. B. M. t. 3367; B. R. t. 1755; Swt. Fl. Gard. ser. 2, t. 250. Syn., *Lophospermum atrosanguineum* and *L. Rhodochiton*.

Rhododendron. (From *Rhodon*, a rose, and *dendron*, a tree. Nat. ord., *Ericaceae*; Tribe, *Rhodoreae*. Closely allied to **Azalea**, which is sometimes united with it.)

Seeds in spring, in shallow pans, in sandy peat, and kept in a close, cool frame until the seedlings are fit to be handled, when they should be pricked off into similar soil, and gradually exposed to sun and air; layers, either in spring or autumn; cuttings of young shoots, when the base close to the older wood is getting firm, inserted in silver sand, and placed, at first, in a cold frame, and afterwards in a little bottom-heat; sandy peat is the best; sandy, fibry loam and clayey loam the next; kitchen-garden soil, and soil of any kind containing or resting upon calcareous matter, the worst. The varieties of the *arbo'reum*, *campanulatum*, etc., require a little protection to have them in their beauty. Excellent figures of many of the species are to be found in Sir J. D. Hooker's "Rhododendrons of the Sikkim Himalaya."

Rhodole'ia. (From *rhodon*, a rose and *leios*, smooth; probably alluding to the rose-like flowers and spineless stems. Nat. ord., *Hamamelidaceæ*.)

Greenhouse evergreen shrub. For cultivation, see CAMELLIA.

R. Champ'oni. Pink. China. 1852. B. M. t. 4509.

Rhodom'yrtus. (From *rhodon*, rose, and *myrtos*, myrtle. Nat. ord., *Myrtaceæ*.)

Greenhouse shrub, requiring the same culture as MYRTUS.

R. tomentosa. 5. Rose. June. China. 1776. Syn., *Myrtus tomentosus*. B. M. t. 250. Hill Gooseberry; India Hill Guava.

Rhodo'ra. (From *rhodon*, rose; referring to the colour of the flowers. Nat. ord., *Ericaceæ*; Tribe, *Rhodoreæ*.) See **Rhododendron**.

R. canadensis. B. M. t. 474. See *Rhododendron Rhodora*.

Rhodospa'tha. (From *rhodon*, a rose, and *spatha*, spathe; the spathe of some of the species is rosy. Nat. ord., *Aroideæ*; Tribe, *Callex*.)

Stove perennial evergreen. Sandy loam and peat. Moist atmosphere. Summer temp., 80° to 90°; winter, 60° to 75°.

R. blanda. 3. Greenish, ochre. Brazil. 1860.

Rhodosta'chys. (From *rhodon*, a rose, and *stachys*, a flower spike; some of the species have spikes of red flowers. Nat. ord., *Bromeliaceæ*; Tribe, *Bromelieæ*. Syn., *Ruckia*.)

Stove herbs, requiring the same culture as BROMELIA.

R. andr'i. 1. Rose. Summer. Andes of Chili. 1850. Rev. Hort. 1855, p. 540, f. 95. Syns., *Bromelia carnea*, *B. longifolia*, and *Ruckia Elemeeti*. *R. grandiflora* and *R. littoralis* are forms of this species.

— *bicolor*. Rose. Tropical America. 1851. Forms of this are:—*Bromelia bicolor* and *B. Joinvillei*.

— *pitcairniaefolia*. Scarlet. Tropical America. 1863. Syn., *Hechtia pitcairniaefolia*.

— — *Kirchoffiana*. Blue. Chili. 1890. Gf. t. 1325.

Rhodosto'ma. (From *rhodon*, a rose, and *stoma*, a mouth; the opening of the tube of corolla. Nat. ord., *Rubiaceæ*; Tribe, *Psychotriææ*.) A synonym of **Palicourea**.

Stove evergreen shrubs. Cuttings of the young shoots in sand, under a bell-glass, and in bottom-heat; sandy, fibry loam and fibry peat. Winter temp., 48° to 60°; summer, 60° to 85°.

R. gardenoides. Moore, Mag. Bot. 1850, p. 65. See *Palicourea gardenioides*.

Rhodotha'mnus. (From *rhodon*, a rose, and *thamnos*, a shrub; the

flowers are rose-coloured. Nat. ord., *Ericaceæ*; Tribe, *Rhodoreæ*.)

A low-growing, much-branched, hardy shrub.

R. Chamæcistus. †. Rose. Alps of Eastern Europe. 1786. Syn., *Rhododendron Chamæcistus*, B. M. t. 488.

— *kamtchat'icus*. Paxt. Fl. Gard. i. t. 22. See *Rhododendron kamtschaticum*.

Rhodoty'pos. (From *rhodon*, a rose, and *typos*, a type or model; because the flowers resemble those of a rose. Nat. ord., *Rosaceæ*; Tribe, *Spirææ*.) Allied to *Kerria*.)

Hardy shrub. Cuttings under a hand-light, suckers, or layers. Garden-soil.

R. kerrioides. 15. White. April. Japan. 1866. B. M. t. 5805.

Rhoe'o. (Derivation unexplained. Nat. ord., *Commelinaceæ*; Tribe, *Tradescantieæ*.)

Stove perennial herb. For cultivation, see TRADESCANTIA.

R. discolor. †. White, pink; leaves purple-edged. 1868. Syn., *Tradescantia discolor*.

— — *concolor*. Leaves entirely green. 1868.

Rhopa'la. See **Roupala**.

Rhopalobla'ste. (From *rhopalon*, a club, and *blastos*, a cell. Nat. ord., *Palmeæ*.)

Stove palm, with slender unarmed stem.

R. hexandra. E. Indies. 1890. Syn., *Bentickia ceramica*.

Rhopalosti'gma. (From *rhopalon*, a club, and *stigma*, a stigma. Nat. ord., *Aroideæ*.) See **Staurostigma**.

Rhopalo'stylis. (From *rhopalon*, a club, and *stulos*, a pillar; referring to the shape of the spadix. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Greenhouse palms, with unarmed stems. For culture, see ARECA.

R. Baueri. 20. White. Autumn. Norfolk Island. 1882. Syn., *Areca Baueri*. B. M. t. 5935.

— *sapida*. 12. Pink. New Zealand. 1827. Rev. Hort. 1873, p. 350. Syns., *Areca sapida*, B. M. t. 5139, and *Kentia sapida* of gardens.

Rhubarb. *Rheum raponticum*, *R. hybridum*, *R. undulatum*, and *R. palmatum*.

Varieties.—There are several varieties, of which the most preferable are the Tobolsk, Gigantic, Victoria (best), and Bucks, or Elfrod.

The *Soil* best suited to it is light, rich, deep, unshaded, and moderately moist.

Sowing.—It may be propagated by cuttings, but usually by seed. Sow soon after it is ripe, in September or October, in drills three feet apart, and an inch deep, the plants to remain where raised; for although they will bear removing, yet it always checks and some-

what lessens their growth. When they make their appearance in the spring, thin to six or eight inches asunder, and let the surface of the ground about them be loosened with the hoe. At the close of summer, when it can be determined which are the strongest plants, finally thin to four feet, or the Gigantic and Victoria to six. Break down the flower-stems as often as they are produced. In autumn remove the decayed leaves, and point in a little well-putrefied stable-dung, and earth up the stools. In the spring, hoe the bed, and as the stalks when blanched are much more delicate in taste, require less sugar to be rendered palatable, and are greatly improved in appearance, dig a trench between the rows, and place the earth from it about a foot thick over the stool. This covering must be removed when the cutting ceases, and the plants allowed to grow at liberty. As the earth in wet seasons is apt to induce decay, the covering may be advantageously formed of coal-ashes or drift-sand. Chimney-pots and butter-firkins make good coverings for blanching.

To obtain Seed.—Two-year-old plants often produce seed, but in their third year always. It must be gathered as soon as ripe, and great care taken that none is scattered over the beds, for the plants thence produced often spring up, and greatly injure the old plants by growing unobserved amongst them.

Forcing.—Plant a single row three feet apart in ground that has been trenched two spades deep, and dressed with well-putrefied dung at the time. The forcing may commence in December; first cover either with sea-kale or common garden-pots (twelves), but chimney-pots are still better, the leaf-stalks becoming much longer and finer, and envelop them with fermenting dung. A frame is much less objectionable, formed by driving stakes into the ground on each side of the bed, alternating with the plants. These are

to be three feet high above ground, and the space between the two rows of stakes two feet at the bottom, but approaching each other, and fastened by cross pieces, so as to be only fifteen inches apart at top. To the sides and top stout lathes are fixed, as in the accompanying sketch, to prevent the dung falling upon the plants.

The dung may be either fresh, or that which has already undergone fermentation, placed all round the frame eighteen inches thick, and the top covered with long litter. The temperature in the interior should have a range from 55° to 60°. If it rises higher two or three large holes made through the top soon correct it.

Rhubarb may be forced without either pots or frame, by merely covering the plants six inches deep with light litter, care being taken that the plants are not injured.

Mr. Knight's mode of forcing is to place in the winter as many plants as necessary in large, deep pots, each pot receiving as many as it can contain, and the interstices entirely filled up by fine, sandy loam, washed in. The tops of the roots are placed on a level with each other, and about an inch below the surface. These being covered with inverted pots of the same size, may be placed in a vinery or hotbed, and on the approach of spring, any time after January, any room or cellar will be sufficiently warm. If copiously supplied with water, the plants vegetate rapidly and vigorously, and each pot will produce three successive cuttings, the first two being the most plentiful. As soon as the third is gathered, the roots may be changed, and those removed replanted in the ground, when they will attain sufficient strength to be forced again in a year's time. If not, it is of little consequence, for year-old roots raised from cuttings, or even seed sown in autumn, are sufficiently strong for use.

Propagation by Division.—Mr. Rogers, a successful cultivator, says, that when the rhubarb is propagated by the root, care must be taken to retain a bud on the crown of each offset, together with a small portion of the root itself, with, if possible, some fibres attached to it. These offsets may be taken from roots of three or four years old without injury to the plant. They may be planted where they are intended to remain, at the same distance and in the same manner as advised for the seedlings.

Rhu's. Sumach. (From *rhudd*, red; colour of the fruit. Nat. ord., *Anacardiaceæ*; Tribe, *Anacardieæ*.)

Hardy deciduous trees and shrubs. By seeds, layers, and cuttings of roots and shoots; light, fibry loam. We have omitted most of the greenhouse and stove species.

Rhyncha'nthera. (From *rhynchos*,

a beak, and *anthera*, an anther; anthers beaked. Nat. ord., *Melastomaceæ*; Tribe, *Microlicieæ*.)

Stove evergreen shrub, with handsome purple flowers. Cuttings of the half-ripened side-shoots, in sandy loam, in heat and under a bell-glass, which should be raised a little to permit free circulation of air, and prevent damping off. Rich sandy loam and fibry peat, well drained. Summer temp., 60° to 85°; winter, 58° to 65°.

R. grandiflora. 6. Deep rose. N. Brazil. 1873. B. M. t. 6011.

Rhynchanthus. (From *rhynchos*, a beak, and *anthos*, a flower; referring to the shape of the flowers. Nat. ord., *Scitamineæ*; Tribe, *Zingibereæ*.)

A stove, tuberous-rooted herb. Strong, rich loamy soil. Division of the roots. Summer temp., 60° to 90°, with plenty of moisture; winter temp., 50° to 60°.

R. longiflorus. 1½. Yellowish, tipped with green. July. Burma. 1885. B. M. t. 6861.

Rhyncho'rupa. (From *rhynchos*, a beak, and *karpos*, fruit; in allusion to the beaked fruit. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumerineæ*. Allied to *Bryonia*.)

Tuberous-rooted greenhouse perennial, but may be grown as an annual in a warm border. Seeds sown in spring in a slight hotbed. Light rich soil. Winter temp., 45° to 55°.

R. fastida. Yellow. Abyssinia. Syn., *Trichosanthes fetidissima*. Jacq. Ic. t. 624.
 — *glomerata.* Brazil. 1880.

Rhynchoglo'ssum. See **Rhincoglossum**.

Rhyncho'sia. (From *rhynchos*, a beak; from the shape of the keel. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Eriosema*.)

Greenhouse or stove perennial trailing or twining herbs. Seeds. Light sandy loam. Summer temp., 60° to 75°; winter, 50° to 55°.

R. al'bo-nitens. See *Desmodium Skinneri*, var. *albo-nitens*.

— *chryso'cias.* Yellow. May. S. Africa. 1871.

— *phaseolo'des.* Yellow, purple. June. West Indies. 1818. Syn., *Glycine phaseoloides*. B. M. t. 2284.

— *violacea.* A synonym of *Eriosema violaceum*.

Rhyncospe'rmum. (From *rhynchos*, a beak, and *sperma*, a seed. Nat. ord., *Apocynaceæ*. Allied to *Apocynum*.)

Evergreen climbers, requiring greenhouse treatment, to be grown in loam and peat, and to be propagated by cuttings under a bell-glass, in sand.

R. angustifolium. See *Trachelospermum jasminoides*, var. *angustifolium*.

— *jasminoides.* B. M. t. 4737. See *Trachelospermum jasminoides*.

R. variegatum and *varium* are varieties of *Trachelospermum jasminoides*.

Rhyncho'stylis. (From *rhynchos*, a beak, and *stylos*, a pillar. Nat. ord., *Orchideæ*; Tribe, *Vandeeæ-Sarcantheeæ*.)

Stove, epiphytal orchids from the East Indies. For culture, see SACCOLABIUM.

R. retusa. 1. White, violet-pink. East Indies. 1820. Syns., *Saccolabium Blumei*, *S. guttatum* (B. M. t. 4108) and *Sarcanthus guttatus* (B. R. t. 1443).
— *Russelia* na. White, mauve-purple. 1886. Syn., *Saccolabium Blumet*, var. *Russelianum*. Warn. Orch. Alb. t. 238.

Rhynchote'chum. (Derivation unexplained. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*. Allied to *Besleria*.)

Stove herb, apparently biennial; and therefore must be raised from seeds. The soil and temperature should be the same as for *GESNERA*, which see.

R. ellipticum. Deep rose. Himalaya. 1870. B. M. t. 5832.

Rhytidophy'llum. (From *rhytis*, a wrinkle, and *phyllon*, a leaf. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*. Allied to *Pentarrhaphia*.)

For culture, see *GESNERA*.

Rice. *Ory'za sati'va*.

Rice Flower. *Pime'lea*.

Rice paper is sliced from the pith of *Fo'tsia papyri'fera*. See p. 382.

Richa'rdia. (Named after L. C. Richard, a French botanist. Nat. ord., *Aroideæ*; Tribe, *Philodendreae*.)

Better known as *Calla æthio'pica*, or the Arum-plant. Greenhouse herbaceous perennial. Suckers and division of the plant in spring; rich, fibry loam. Winter temp., 35° to 48°; should be kept dryish for a time before growing, so as to get it to throw up its flowers. Thrives well in a cistern in a greenhouse where there is abundance of light, and in a stream of water during the summer, the pots being plunged within it.

R. æthio'pica. 8. Creamy. March. South Africa. 1731. Syns., *R. africana* and *Calla æthio'pica*. B. M. t. 832.

- *africa'na*. See *R. æthio'pica*.

 — *scabra*. See *Richardsonia scabra*.

Richardso'nia. (Named after R. Richardson, an English botanist. Nat. ord., *Rubiaceæ*; Tribe, *Spermacocææ*.)

Stove evergreen. Cuttings of young shoots in sandy soil, and in a moist bottom-heat; fibry loam and peat, and a little sand and leaf

mould. Winter temp., 48° to 58°; summer, 60° to 80°.

R. sca'bra. 2. White. September. Brazil. 1814. Swt. Fl. Gard. t. 91. Syn., *Richardia scabra*.

Riche'a. (Named after Mr. Ritchie, an African traveller. Nat. ord., *Epacridaceæ*; Tribe, *Epacreae*.)

Greenhouse shrubs or small trees. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a mild, sweet bottom-heat; sandy, fibry peat, with a few nodules of fibry loam and charcoal. Winter temp., 55° to 60°; summer, 60° to 88°.

R. fra'grans. This was erroneously given on p. 266 as the proper name for *Cratæva capparoides* and *C. fragrans*; it should have been *Ritchiea fragrans*, which see.
 — *pandanifo'lia*. 20. Australia. 1883.
 — *sprengelko'des*. 5. Reddish. June. Australia. 1836.

Ri'cinus. Palma Christi. (From *ricinus*, a tick; resemblance in the seeds. Nat. ord., *Euphorbiaceæ*; Tribe, *Crotonææ*.)

Annuals by seeds in a hotbed; shrubs by cuttings in a hotbed; light, rich soil. The shrubby kinds should have the addition of a little peat. They are all too tender to do much good out of doors. The following are all half-hardy annuals, except *li'vidus* and *ru'tilans*:

- R. arma'tus*. Andr. Rep. t. 430. See *R. communis*.
 — *cambridge'nsis*. 1887. Probably a form of *R. communis*.

 — *ru'tilans*. Reddish-white. August. 1827. Half-hardy biennial.
 — *undulatus*. Red, white. August. 1827.

Rico'tia. (Probably a commemorative name. Nat. ord., *Cruciferae*; Tribe, *Alyssineæ*.)

Hardy annual. Seeds; light, sandy soil. Good for beils, knolls, or rock-works.

R. luna'ria. Lilac, purple. June. Egypt. 1757. Swt. Fl. Gard. ser. 2. t. 411. Syn., *R. ægyptiaca*. B. R. t. 49.

Ridling. Another name for sifting.

Ridging is digging the soil into

ΛΛΛ parallel ridges in this form, so as to expose it thoroughly to the action either of the atmosphere or of frost.

Ridging-out. Planting out Cucumbers and Pumpkins in the open-ground beds. Ridging, however, should not be confined to the winter, for in summer the extra exposure to the air and heat is highly promotive of vegetation: it

impregnates the soil with oxygen, promotes the decay of stubborn vegetable remains, and disturbs predatory vermin. Mr. Barnes says, "I keep all ground, as soon as a crop is done with, well trenched, burying all the refuse I possibly can in a green state, casting the earth into rough ridges, tumbling those ridges over with a strong fork on frosty mornings in winter and spring, and during hot sunny days in summer, continually changing the crops; keeping the hoe at work at all seasons in suitable weather, forking up all odd corners and spare ground without loss of time. By this management, I find the ground is always in good condition and never tired by cropping, some judgment only being exercised in applying such properties again to the soil that have been taken from it, or that are likely to be required by the succeeding crop."

The most effectual mode of ridging is thus described by Mr. Parkins:

Let *a*, *b*, *c*, *d* represent a section of the ground to be trenched two feet deep. In the first place the ground is measured

out in longitudinal beds four feet wide; this done, the top spit of the bed *c* is laid on the bed *g*, and the second spit of the bed *c* is laid on *h*. The first or top spit of the bed *f* is then laid on *h*, so that the top soil and subsoil are kept on separate and alternate beds, and may be mixed, reversed, or returned as taken out, at the will of the operator. By this method the advantages are—much greater exposure of surface to the action of the weather; the opportunity of incorporating with the soil any desirable or obtainable manures, and at any desired depth; a thorough blending of the soil to the depth of two or three feet; and it also facilitates the operation of draining where necessary. It is needless to add, that when the first thrown-out beds are sufficiently pulverized, they are levelled down, and others thrown out in the same manner; *g*, *h*, *i* represent the ridges thrown out and left as rough as possible.

Rigida. (From *rigidus*, stiff; the stiffness of the flower-stalk. Nat. ord., *Iridææ*; Tribe, *Moræææ*. Allied to *Tigridia*.)

Half-bardy bulbs. Offsets in spring; also by seeds in a hotbed; rich, sandy loam and peat; bulbs require to be kept from frost and damp during the winter.

- R. flammæa*. 5. May. Mexico. 1839. B. R. 1840, t. 16.
 — *immaculata*. 1. Crimson. June. Guatemala. 1839. Fl. Ser. t. 502.
 — *orthantha*. 1½. Crimson. June. Mexico. 1846. Fl. Ser. t. 46.

Ringing is cutting away a belt of bark quite down to the wood entirely round a branch. This checks the return of the sap, and aids to make that branch more fruitful, and the fruit on it finer. We have seen it done with the best effect upon the pear and grape-vine. It should be done just previously to the blossoms opening. When first suggested it was called the *Ring of Pomona*. See **Ligatures**.

Riocreuxia. (Named after A. Riocreux, a celebrated botanical artist. Nat. ord., *Asclepiadaceæ*; Tribe, *Ceropegieææ*. Allied to *Ceropegia*.)

A free-flowering greenhouse climber. Cuttings in sand, in a slight bottom-heat and under a hand-glass; they are best taken in spring. Sandy loam, well drained; give plenty of pot room. Summer temp., 60° to 85°; winter, 45° to 55°.

- R. torulosa*. Yellowish. S. Africa. 1862. Ref. Bot. t. 157.

Ripening Wood is one of the principal objects to be aimed at for the production of either flowers or fruit the following year. To effect this, at the end of August, or early in September, superfluous branches should be removed, and shoots stopped, to concentrate the sap, and expose those retained to the full influence of the sun.

Ripogonum. (From *ripis*, flexible, and *gonos*, a shoot. Nat. ord., *Liliaceææ*; Tribe, *Smilacæææ*.)

Greenhouse, white-flowered, evergreen climbers, from Australasia. Cuttings of side-shoots, when three inches in length, taken off close to the stem, in sand, under a bell-glass, in May; fibry loam, a little peat, sand, and charcoal, and well-drained. Winter temp., 40° to 48°.

- R. album*. 3. June. Port Jackson. 1820.
 — *parviflorum*. A synonym of *R. scandens*.
 — *scandens*. 2. June. New Zealand. 1820.

Ritchiea. (In honour of Mr. Joseph Ritchie, who travelled in Central Africa, and died 1819. Nat. ord., *Cappariaceææ*; Tribe, *Cappareæææ*.)

- Stove shrubs. For cultivation, see **CRATEVA**.
R. fragrans. 15. Whitish. June. Sierra Leone. 1795. Syns., *Cratæva capparioides* and *C. fragrans*. B. M. t. 596.
 — *polypetalata*. White. Tropical Africa. 1862. B. M. t. 6344.

Rivea. (Named after A. de la Rive, a Genevan botanist. Nat. ord., *Convolvulaceææ*; Tribe, *Convolvuleæææ*. Allied to *Ipomææææ*.)

Stove evergreen twiner. Cuttings of side-shoots, and of the young shoots, several inches in length, as they rise from the roots in spring; or grafting on a free-growing *Ipomææææ*; fibry

loam and rough, sandy peat. Winter temp., 55° to 60°; summer, 60° to 85°.

R. tiliaefolia. White. June. E. Ind. 1812.
A synonym of *Argyrea tiliaefolia*.

— *zeylanica*. See *Argyrea zeylanica*.

Rivina. (Named after A. Q. Rivinus, a German botanist. Nat. ord., *Phytolaccaceæ*; Tribe, *Rivineæ*.)

Called *rouge plants* in the West Indies, where the fruit is used as a cosmetic. Stove evergreens. Seeds and cuttings. The flowers are of little beauty; but the racemes of ripe and ripening fruit are very interesting; light soil. Winter temp., 50° to 60°; summer, 60° to 80°.

Roan-tree. *Pyrus aucuparia*.

Robe'rgia. (After Lorenz Roberg, Professor of Medecine at Upsal at the commencement of the eighteenth century. Nat. ord., *Connaraceæ*; Tribe, *Connaraceæ*.)

R. frutescens. See *Rourea frutescens*.

Robi'nia. (Named after J. Robin, a French botanist. Nat. ord., *Leguminosæ*; Tribe, *Galegæ*. Cobbett's Locust-tree is *Robi'nia pseudo-acacia*.)

Deciduous, white-flowered trees, from North America, where not otherwise stated. Fortender kinds, cuttings of young wood in sand, under a glass. The *Locust-tree*, in all its varieties, by seed sown in autumn, or preserved in the pods, and sown in the spring; by cuttings of the shoots; by cuttings of the roots; by suckers and layers. The finer varieties are generally grafted. The *hispidia rosea*, or *Rose Acacia*, is a fine object grafted on the *pseudo-acacia* standard high, in a sheltered place not much north of London. The finer varieties of *hispidia rosea*, in cold situations, deserve a place on a conservatory wall, and would be a nice companion to the *Glycine sine'nsis*, etc.

Rocambo'le (*Allium Scorodo'prasmum*), sometimes called *Spanish Garlic*, has its bulbs or cloves growing in a cluster. The stem bears many bulbs at its summit, which, as well as those of the root, are much milder than Garlic.

It is best propagated by the root bulbs, those of the stems being slower in production. Plant either in February, March, or early in April, as well as throughout the autumn, in drills, or by the dibble, in rows six inches apart each way, and usually two inches within the ground, though the plants would thrive better if grown on the surface, as recommended for the Eschallot. In other respects they are cultivated as directed for Garlic. A very small bed is sufficient for the supply of the largest family.

Ro'chea. (Named after *La Roche*, a botanical author. Nat. ord., *Crassulaceæ*; Allied to *Bryophyllum*.)

Greenhouse evergreen succulents, from South Africa. For culture, see *CRASSULA*.

- R. albiflora*. See *Crassula albiflora*.

Rock Carrot. *Mon'zia e'dulis*.

Rocket. *He'speris*.

Rocket Larkspur. *Delphi'nium ajacis*.

Rock Lychnis. *Visca'ria*.

Rock Rose. *Cistus*.

Rock Tobacco. *Primuli'na Tabacum*.

Rock-work is one of the most difficult things to construct tastefully. If the body of the rock is intended to be raised much above the ground level, a quantity of soil should be carried into the centre of the space. This soil, besides serving to support the rock-work, will also form a medium for the plants to grow in. Having at hand plenty of large, rough stones, of any kind or colour, proceed with these to imitate the form of natural rock as nearly as possible. Rough, bold, angular projections, and deeply-formed chasms, are the principal features in natural scenery which please us most. A rock, with a flat unbroken surface, whether horizontal or perpendicular, presents too much sameness to be pleasing to the eye; therefore, in imitating nature, the projections should be varied and bold, and unless raggedness and intricacy form principal features in its composition, it will lose much of its effect. If the rock-work be on a large scale, it should not be one continued line, but broken at intervals, in one part lost beneath the surface of the earth, and again rising in another part and resuming its sinuous form.

So far there is little difference between this and the common method of making artificial rock. When, however, every stone has been arranged to suit the eye, the interstices between them are to be

filled up with any kind of rough material. Of course, fissures, and similar places intended for the plants which are to cover the rock, must be well packed with good soil, so that the roots may penetrate to the body beneath the stones. The spaces between the stones having been filled with good soil, the roots naturally find their way to the larger feeding area. The thickness of the latter on the stones need not be more than the eighth of an inch: it will unite the whole into one mass; and rock-work thus constructed is, beyond all comparison, far more natural than that made in the usual way.

In making artificial rock for waterfalls, or other constructions, where the cement used may be constantly exposed to the action of the water, the best water-cement should be used. Any preparation that does not quickly indurate under water will, in a short time, be washed away, and leave nothing but the bare stones.

Rodgersia. (Named after *Admiral Rodgers*, U.S. Navy, commander of the expedition during which it was first discovered. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifragææ*. Allied to *Saxifraga*.)

Hardy herbaceous perennial. Divisions. Rich loam and peat.

Ro'hdea. (In honour of M. Rohde. Nat. ord., *Liliaceae*; Tribe, *Aspidistreeae*.)

Greenhouse, almost aquatic. The name is sometimes spelt RHODEA.

- R. japonica*. Japan. 1865. Syn., *Orentium japonicum*, B. M. t. 898. There are three variegated-leaved varieties.

Roller. This is best made of cast iron, and may be had in various sizes, the most useful having a diameter of either sixteen, eighteen, twenty-two, or twenty-four inches. The roller is best used the day after a fall of rain.

Romanzo'fia. (Named after Count Romanzov, a Russian nobleman. Nat. ord., *Hydrophyllaceae*.)

Hardy perennial herb, suitable for rockwork; it has much the appearance of a *Saxifraga*, and requires the same treatment.

- R. sitchensis*. $\frac{1}{2}$. White. April. Sitcha. 1873. B. M. t. 6109.

Ro'mneya. (Named after Rev. Dr. T. Romney Robinson, an astronomer of Armagh. Nat. ord., *Papaveraceae*; Tribe, *Romneyæ*. Allied to *Platystigma*.)

A fine and showy herbaceous perennial, which, although half-bardy, thrives best and produces larger and more abundant flowers if kept in a cool greenhouse. Seeds sown in spring. Rich sandy loam. Winter temp., 45° to 50°.

- R. Coulteri*. 4. White. California. 1875. Flor. Mag. t. 252.

Romu'lea. (In honour of *Romulus*, the reputed founder of Rome. Nat. ord., *Iridæe*; Tribe, *Ixiæe*.)

Greenhouse, or hardy bulbous plants.

- R. bulbocodium*. $\frac{1}{2}$. Greenish-yellow. June. South Africa. 1810. Syn., *Trichonema caulescens*. B. M. t. 1392. Greenhouse.

Rondeletia. (Named after W. Rondelet, a Frenchman. Nat. ord., *Rubiaceæ*; Tribe, *Rondeletiacæ*.)

Stove evergreen shrubs. Cutting of the points of the shoots, getting slightly firm, in sand, under a bell-glass, and in bottom-heat; the glass being raised at night, and in dull weather, to prevent damping; fibry peat and fibry loam, with enough of sand, broken pots, and charcoal to insure openness in the soil. Winter temp., 48° to 55°; summer, 60° to 85°.

Ronnbergia. (Named after M. Ronnberg, director of agriculture and horticulture to the Minister of the Interior of Belgium. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliaceæ*.)

Stove perennial. A very distinct and remarkable genus among Bromeliads on account of its stalked, entire leaves. For cultivation, see *BILBERGIA*.

- R. columbia'na*. 1. Dark blue, white. Columbia. Syn., *Billbergia columbiana*.
- *Morrenia'na*. Blue, white. Columbia. 1874. Ill. Hort. 1874, t. 177.

Roots are either annual, biennial, or perennial; but in all roots, and under any mode of management, the fibrous parts (*radiculæ*) are strictly annual; they decay as winter approaches, and are produced with the returning vigour of their parent in the spring. Hence the reason that plants are transplanted with most success during the season of their decay; for, as the root almost exclusively imbibes nourishment by means of these fibres, so in proportion as they are injured by removal is the plant deprived of the means of support: that sap which is employed in the formation of new fibres would have served to increase the size of other parts.

Roots always travel in the direction where most food is to be obtained; therefore, for carrots and parsnips, let a little manure be turned in with the bottom spit when the ground is trenched for them. So, if it be desirable to prevent the roots of any plant travelling in a certain direction, the soil on that side should be excavated, and the cavity refilled with sand, or some other unfer-tilile soil, whilst the soil on those sides of the plant whither the roots are desired to tend should be made as fertile as is permissible with its habits.

Whatever causes an excessive development of root prevents the production of seed; and *vice versa*, the production of seed, especially in tuberous-rooted plants, reduces the amount of root developed. Thus, frequent transplanting the young plants of the lettuce, brocoli, and cauliflower causes the production of numerous fibrous roots, and is found effective in preventing the mature plants advancing early to seed.

The early varieties of the potato do not naturally produce seed; but if their tubers are removed as soon as they are formed, these early varieties blossom and bear seed as freely as the later kinds, a fact suggesting many experiments to the cultivator of shy-blooming tuberous-rooted flowers. Again, if the blossoms of these later varieties are

plucked off as they appear, the weight of tubers produced will be very materially increased.

Root-pruning, first adopted as a systematic practice by Mr. Errington, has for its object a check to over-luxuriance. This it does effectually, for such excess of growth arises from the roots imbibing too much food. By pruning, and thus reducing their number, therefore, we reduce their imbibing power; and it is found that such pruning checks the production of leaf-buds, and will cause any kind of fruit-tree to produce blossom-buds, provided the tree is healthy, and that its barrenness arises from over-luxuriance. To know what proportion of the roots to cut away, we may suppose the trees thrown into three classes. First, trees of moderate luxuriance; second, those which may be termed robust; third, those of gross habit. To give a further idea, we would say that the first class will make young shoots, on an average, a foot in length; those of the second two feet; and the third nearly, or quite, three feet; the latter, indeed, frequently burst into lateral or side-shoots from the young shoots of the same season.

From the first class, therefore, we advise the cutting away about a sixth part of the roots; from the second class a fourth part; and from the third class a third part. It must be borne in mind that *the extremities of the roots alone* should be cut off, for while we advocate this mutilation, we equally advocate the preservation of the *surface* roots by every possible means; nay, more than that, we recommend their encouragement by extra appliances of manure to the surface-soil.

Ro'pala. See **Roupala.**

Ro'sa. Rose. (From the Celtic *rhod*, red; prevailing colour. Nat. ord., *Rosaceæ*; Tribe, *Roseæ*.)

For culture, see **ROSE**. A classification of this genus, by J. G. Baker, F.R.S., will be found in the "Journal of Botany," 1885, p. 281; and another by M. Crépin in the Journal of the Royal Horticultural Society, xi. p. 217 (1889).

Rose. Ro'sa.

Propagation.—Most kinds of roses can be propagated by cuttings. By this method we only obtain dwarfs; yet, as many sorts do best on their own roots, the China and Tea-scented for instance, for these we must adopt cuttings. The best time for making the cuttings is in April.

Cuttings in Pots.—The most convenient-sized pots are five inches across; fill them with moderately rich, light earth, press it firmly down, then fill the pots quite up to the rim with silver sand, or with finely sifted river sand; give a gentle watering from a fine-rosed watering-pot, then cut the cuttings into lengths of about four inches, remove all the leaves except those belonging to the top buds, make the cut very smooth across, just under the lowest bud; the cutting is then ready to be planted. Have a small stick about as thick as a quill, and thrust it into the soil just the top bud out; close the earth firmly to the bottom of the cutting with the stick; place the cuttings close to the edge of the pots, with the leaves of all pointing inwards; then close up the holes with a little of the sand, and give a gentle watering. The best situation to place the pots is in a pit, with hand-glasses over them. If you have not that convenience, plunge the pots in coal-ashes on a shady border, covering them with hand-glasses. Shift into larger pots as they require.

Cuttings in the Open Ground.—Choose a shady border, next a low wall or hedge

—the latter to be close-clipped with the garden-shears. Let the soil be well dug and chopped small, and the surface raked very fine; then pour some water upon it, and let it stand a day, to become moderately dry again. Prepare the cuttings as above directed, and always expose the cuttings as little as possible to the sun and air; they may be preserved fresh by having a little damp moss or hay at hand to cover them with as soon as they are prepared. When a sufficient number are ready, open a trench with a small spade at the end of the border. Chop the side of the trench furthest from you straight down just a sufficient depth to leave the topmost bud and leaf out of the soil; then place the cuttings against this upright bank about three inches apart. When the row is filled with cuttings, with your spade put the soil against the cuttings, and with your foot tread it firmly to them. Take great care that the soil is quite close and firm around each. Then fill up level with the top of the row of cuttings another portion of soil, until there is a bank of earth six inches distant from the first row. Chop down the outermost edge of the soil, so as to leave another upright bank to set the second row of cuttings against, and so proceed from row to row, till you have filled the space set apart for this purpose. Examine a few of them occasionally after about six weeks, and if they are rooted, lift them carefully with a trowel or small spade, and either pot them or plant them out in rows in a more open situation. By the autumn following they will be nice plants, and may be planted in the situation where they are to grow and flower.

By Suckers.—Roses send up many suckers annually, which may be taken up in autumn, winter, or early spring, with some rootlets attached; and the strongest may be planted out finally, and the weakest in the nursery for a year or two longer. They will readily grow, and will most of them produce flowers the following summer. When rose-trees have grown into large bunches, with many suckers, the whole may be taken up and slipped, or divided into separate plants. The Moss and some others furnish suckers but sparingly.

By Layers.—To obtain shoots for layering, a quantity of rose-trees should be planted for stools, which, being headed down low, will throw out shoots abundantly, near the ground, in summer, for layering in autumn or winter following. (See **Layering.**) They

will be rooted by next autumn, and fit for transplantation in nursery rows, though sometimes the moss rose and some others require two years before they are tolerably well rooted; but of these sorts you may also try layers of the shoots of the year, layered in summer, any time in June. They will probably root a little the same season. The layers of all the sorts, after being properly rooted, should be taken up in autumn and planted in the nursery, to have one or two years' growth.

By Budding.—See **Budding and Grafting.**

Soil and Situation.—The best soil is a rather strong loam: the deeper it is the better. It should be well-drained. Such land as will grow good wheat or good hops will grow fine roses. Next, it should be rich to grow them fine: if not already so, it ought to have thoroughly decayed dung added to it. A portion of super-phosphate of lime (bones dissolved in oil of vitriol) will be of great benefit to them—a manure that may be had of any respectable manure-dealer. The rose-garden ought to open to the south and east, but be sheltered from the north and north-west winds. Tall beech or horn-beam hedges are the best shelter against gales blowing from those points. Roses should not be planted so near trees as to be overhung by them, as the drip from the trees will prevent them from thriving, and injure the flowers.

Planting.—The best season is the early part of November. They will succeed tolerably even to the middle of March, but not so well as in the autumn. If you have to procure them from a distant nursery, and they are some time out of the ground, make a puddle of earth and water of nearly the consistency of paint. Dip the roots in this puddle, and plant them immediately. Should the border intended for the rose be long and narrow, plant the tallest standards in the back row, the next size in the second, and the half-standards in the third, and the dwarfs in the front row.

Autumn Pruning: Summer Roses.—*Provence, including the Moss Rose.*—These require to be pruned to three or four eyes, according to the strength of the shoots. *Damask.*—These require to be pruned according to the strength of the growth of the different varieties. *Madam Hardy*, for instance, is a strong grower, and ought to be left with shoots of six eyes. *White Damask.*—This species should be pruned similarly to the *Damask*. *Gallica, or French.*—Some of

these are very strong growers, and must be cut accordingly. Some shoots, in good soil, will grow three or four feet long. Those shoots are often pithy and green, and ought to be cut clean out, and the rest shortened to one foot or eighteen inches, according to their strength. *Hybrid, Provence.*—They grow naturally in compact heads and many branches, and should be pruned by thinning out about one-third of the shoots, and shortening the rest to six or eight eyes. *Hybrid, Chinese.*—The strong growers, *Brennus* for instance, must be cut to eight or nine eyes; whilst the *Beauty of Billard* is a weak grower, and should be cut to two or three eyes, and half the shoots entirely cut away. *Scotch.*—All that these require is to have half of the shoots thinned out, and those that are left cut to half their length. *Climbing.*—These require a different mode of pruning to all other roses. We shall describe it as the spur system. Train in young shoots during the summer; in the autumn shorten those shoots one-fourth of their length—that is, supposing the shoot is four feet long, cut one foot of it off, and so reduce it to three feet, and in the same proportion for longer shoots. The shoots will then, during the summer, produce side-shoots; these are the spurs. In the month of March following, take the shoots off the trellis walls or pillars, prune the spurs into two or three eyes, and then tie or nail them up again neatly to the supporters.

Autumn Pruning: Autumn Roses.—*Macartney.*—The *Macartney* rose itself requires very little pruning; but the *Maria Leonidas* requires pruning freely, shortening the strong shoots to eight or nine eyes, and the weak ones to three or four. *Damask Perpetuals* and *Hybrid Perpetuals* are mostly weak growers, and should be cut into four or five eyes, and a third of the shoots cut clean away. *Bourbons* and *Noisettes* are middling growers, and should be pruned moderately; strong shoots to be cut to five or six eyes, and the weak ones to three or four. *China and Tea-scented.*—Most of these are rather tender; consequently, the wood does not ripen to any length. They should, therefore, be pruned close. If they are planted against a wall they may be pruned longer, as the wood then becomes firmer and better ripened. Prune those in the open air, both standards and dwarfs, to two or three eyes, those on walls to six or seven, in proportion to their strength.

Summer Pruning.—It often happens,

where the roses are growing in good ground, that some of them produce branches that grow so strong and fast as to rob the rest of their due support. These branches are what the French call *gourmands*, which may be Englished *gluttons*. Only stop these at first, and wait until the autumn before you cut them clean off. When the rose-trees throw out a great number of shoots equally strong, and they appear to be crowded, prune away about one-third of them, but do not shorten any of the others, as that will cause them to send out a quantity of small, weak shoots, which will injure the flowers the following season.

Roses in Pots.—Procure some pots that are well cleaned, or, what is better still, quite new; and 24's are a very convenient size to commence with. Worked roses are preferable, for pot purposes, to those grown on their own roots; therefore select such as are dwarf standards only, and worked close to the collar, so that when the rose is potted the stem is scarcely visible. *Tea, China, and Bourbon*, or their hybrids, are better suited for forcing and pot plants than *Noisette* and *Hybrid perpetuals*; the two last-named classes of roses grow to greater perfection in the open air. Amongst *Tea Roses* select *Saffrano, Devoniensis, Comte de Paris, Nephotos, and Princess Clementine. Mrs. Bosanquet, Duchess of Kent*, with a few others, amongst *Chinas*; *Souvenir de Malmaison, Leveson Gower, and Dupetit Thouars*, amongst *Bourbons*. Of the above *Souvenir de Malmaison* is unrivalled as a pot rose. Having selected plants, lose no time; but before the roots have got dry, pot them (having first pruned the strong roots) in a mixture of half yellow loam, and the rest old cow-dung, leaf-mould, and sand in equal parts; but a greater proportion of loam may be added with advantage, should the rose to be potted be a *Bourbon* or *Hybrid perpetual*. The plants being potted in October, place them on ashes under a north wall, in some sheltered part of the garden, until the frosts compel them to be put in cold pits, keeping them, since their being repotted, as dry as can be to prevent growth, but not sufficiently so as to cause the plants to flag, or their roots to get quite dry. Then, about the commencement of December, prune all that you intend bringing into the greenhouse in the early part of January, for blooming in May and June, and stimulate them gently by applying water at a temperature a few

degrees warmer than the atmosphere of the pit where they still are, so as when they are introduced into the greenhouse at the commencement of January, at a medium temperature of 45°, they are just beginning to push strongly. About the commencement of February a little more heat is to be given, and weak liquid-manure is applied about twice a week, which is strengthened as the plants increase in vigour and have their buds well set. About this time syringing over-head with lukewarm water, or steaming, may occasionally be had recourse to, as it tends to give strength to the plants, and keeps away the aphid and other enemies. Lastly, when the shoots are sufficiently long for the purpose, they are to be gently brought down to the sides of the pot, or staked to such places as they are intended to occupy, so as when the plants are ready for the show, these appliances may be removed, and the plant still preserve a round and uniform appearance. It is necessary at all times, when the temperature is at 50° or above, to give as much air as possible; and this may even be done when a gentle fire is going.

Diseases.—See **Extravasated Sap, Green Centre, Mildew, and Rose Rust.**

Insects.—See **Aphis, Anisopia, and Tortrix.**

Rose Acacia. *Robi'nia hi'spida.*

Rose Apple. *Jambo'sa.*

Rose Bay. *Epilo'bium angustifolium.*

Rose Champion. *Ly'chnis.*

Rosemary. *Rosmar'nus officina'lis.*

Varieties.—There are three varieties—the green, golden-striped, and silver-striped. The first is in general cultivation.

Soil.—It thrives best on a poor, light soil mixed with old mortar, or other calcareous matters. In such, or when the plants are self-raised on an old wall, they will bear our severest winters; but in a rich soil they lose much of their aromatic nature, and perish in frost. For the green variety, the situation may be open; but the other two, being tender, require to be planted beneath a south wall, or in pots, to be sheltered in winter.

Propagation is by cuttings and rooted slips during any of the spring months, or by layers in the summer; but the finest plants are raised by seed. By layers is the best mode of propagating the gold and silver-striped varieties.

Sow in March, or early in April, in drills half an inch deep and six inches apart. The rooted slips, and the cuttings of the young shoots, must be from five to seven inches long, and planted in a shady border, in rows eight or ten inches apart, previously removing the leaves from the lower two-thirds of their length. Layers may be formed by cutting young branches half through on their under-side, and pegging them down an inch or two below the surface: they become established plants by autumn. Water must be applied abundantly at the time of planting, and occasionally afterwards until established.

Rose of Heaven. *Ly'chnis ca'li-ro'sa.*

Rose of Jericho. *Anasta'tica.*

Rose of the World. *Came'llia japo'nica ro'sa-mu'ndi.*

Rose Root. *Se'dum Rhodi'ola.*

Rose Rust, and Brand. Roses attacked with this disease present a sickly yellow hue, and if the leaves are examined in an early stage of the disease their under sides will appear sprinkled with yellow dust. In this stage the disease is termed "Rust," at a later period, black dots appear among the yellow dust and constitute the stage of the disease termed "Brand." These appearances are due to a minute fungus. Formerly the Rust and Brand were thought to be produced by two distinct species of fungus, and were even placed in distinct genera; but they are now known to be but two phases of existence of the same fungus, to which the name *Phragmi'dium mucrona'tum* is given.

If the Brand be examined under a microscope it will be found to consist of a multitude of blackish, oblong, pointed, several-celled bodies, borne on colourless stalks as represented in our engraving. The oblong body at length breaks up into as many spores as it has cells. After a shorter or longer period, these spores germinate, and develop a fine, thread-like, branched mycelium. Upon short branches of this mycelium are developed the minute round yellow spores, which constitute what is called Rust. When ripe, these spores become detached from the mycelium; they soon germinate and produce a fresh mycelium, from which the Brand spores are developed, and thus the cycle completed.

The only remedy known to us is to syringe the Rose trees with a very fine hose, and then dust them well with powdered sulphur.

Rose Snowball-Tree. *Viburnum opulus ro'seum*.

Rosmarinus. Rosemary. (From *ros*, dew, and *marinus*, of the sea; maritime plants. Nat. ord., *Labiatae*; Tribe, *Monardece*.)

Hardy evergreens, purple-flowered, and natives of the South of Europe. See ROSEMARY.
R. officinalis. 4. February. 1548. Sibth. Fl. Gr. t. 14.
 — *fo'lis-argenteis*. 4. March. 1548.
 — *fo'lis-aureis*. 12. February. 1548.
 — *latifolia*. 12. February. 1548.

Rostelle'ra, is a corruption of **Rot-tilera**. See **Mallotus**.

Rotation of Crops. There are three circumstances to be regarded in regulating the order in which crops should follow each other:—1. Each crop should be as dissimilar as possible from its predecessor. 2. The exuvia of the preceding crop should not be offensive to its successor. 3. A spindle-rooted crop should succeed a fibrous-rooted crop, or *vice versa*.

Ro'thia. (Named after *A. W. Roth*, a German botanist. Nat. ord., *Leguminosae*; Tribe, *Genistaceae*.)

Hardy trailing annual. Seeds in a warm border, in April.

R. trifolia. 2. Sulphur. July. India. Wight. Ic. t. 199.

Rothma'nnia. (After *G. Rothmann*, an African traveller. Nat. ord., *Rubiaceae*.)

R. longifolia. Par. Lond. t. 65. A synonym of *Randia maculata*.

Ro'ttilera. See **Mallotus**.

Rouge Plant. *Rivina tinctoria*.

Roupa'la. (From *roupala*, the Guianan name. Nat. ord., *Proteaceae*; Tribe, *Grevilleae*. Syns., *Rhopala* and *Ropala*.)

Greenhouse evergreen shrubs, from South America. Cuttings of ripe shoots in sand, under a bell-glass, not hurried, but freed from damp, and placed in bottom-heat after a few weeks; fibry loam and sandy peat. Winter temp., 45° to 48°; a rather sheltered place in summer.

R. aurea. Stem and petioles golden-haired. St. Catherine's, Brazil. 1866.

Roupe'lia. (In honour of the *Roupe'li* family, encouragers of botany. Nat. ord., *Apocynaceae*.)

A shrubby, climbing stove plant. Cuttings of young shoots in sand, under a bell-glass, in heat. Fibry peat and loam. Summer temp., 60° to 85°; winter, 50° to 60°.

R. grata. White, pink. May. Sierra Leone. B. M. t. 4466. The flowers are very fragrant. The fruit is the *Cream Fruit* of its native place.

Rou'rea. (Derivation not stated. Nat. ord., *Connaraceae*; Tribe, *Connarceae*.)

Shrub, requiring stove treatment.

R. frutescens. 6. White. Guiana. 1823. Syn., *Robergia frutescens*.

Rowan Tree. *Pyrus Aucuparia*.

Roxbu'rgia. (Named after *Dr. Roxburgh*, once Director of the Botanic Garden, Calcutta. Nat. ord., *Roxburghiaceae*.) A synonym of **Stemona**.

Stove twining plants, with stems one hundred fathoms long in the hottest parts of India, where the roots are candied with sugar, and taken with tea. Propagated generally by suckers; sandy, fibry loam, and a little leaf-mould, and the usual plant-stove temperature.

R. gloriosa, B. M. t. 1500, *R. gloriosoides*, Wight. Ic. t. 2061, and *R. viridiflora* are all forms of *Stemona gloriosoides*.

Royal Bay. *Laurus nobilis*.

Royal Fern. *Osmunda regalis*.

Roy'dsia. (In honour of *Sir John Royds*, once a judge in the Supreme Court of Judicature of Bengal. Nat. ord., *Capparidaceae*.)

Stove shrub. Good, rich loam. Cuttings of young wood.

R. suaveolens. Dull red, yellowish. January to May. India. B. M. t. 6881.

Roye'na. (Named after *A. Van Royen*, a Dutch botanist. Nat. ord., *Ebenaceae*.) Allied to **Diospyros**.

Greenhouse evergreen shrubs, from South Africa, all but one white-flowered. Cuttings of half-ripe shoots in sand, under a bell-glass, in April or May; sandy loam and fibry peat. Winter temp., 40° to 48°; summer, 60° to 75°.

Syn., *R. pubescens*, B. R. t. 500.

Roylea. (Named after *Professor Royle*, of King's College, London. Nat. ord., *Labiatae*; Tribe, *Stachydeceae*. Allied to **Ballota**.)

Greenhouse evergreen shrub. Cuttings of young shoots in spring, in sandy soil, with a

bell-glass over them; sandy loam and leaf-mould. Winter temp., 40° to 48°.

R. legans 2. Purple. July. Nepaul. 1824.

Rube'ntia. (From *ruber*, red; the wood is red. Nat. ord., *Celastrineæ*.) A synonym of **Elæodendron**.

R. angustifolia. See *Toddalia angustifolia*.
— *olivifolia*. A synonym of *Elæodendron orientale*.

Ru'bia. Madder. (From *ruber*, red; and the colour of the roots. Nat. ord., *Rubiaceæ*; Tribe, *Galieæ*. Allied to *Galium*.)

Half-hardy species, from cuttings in spring, under a hand-light, and peat and loam; the others are herbaceous plants, propagated by division of the roots, and flourishing in any good garden-soil; from *tinctorum* madder is obtained. This genus differs from *Galium* in having a 5-lobed, instead of 4-lobed, corolla.

HALF-HARDY EVERGREENS.

Rue, or Herb Grace. (*Ru'ta grave'olens*.) Thrives best in a poor, clayey loam, mixed with calcareous rubbish, in an open situation. It is propagated by slips and cuttings as well as from seeds, the first two modes being usually practised as being the most easy. It may be planted or sown at any time during the spring. The seed in drills six inches apart, and a quarter of an inch deep. The rooted slips, or cuttings, may be planted on a poor, shady border, and watered occasionally until taken root. In the autumn the plants may be removed. During their after-growth they must be kept pruned in a shrubby form, and never be allowed to produce seed.

Rue'llia. (Named after *J. Ruella*, a French botanist. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*. Syn., *Dipterocanthus*.)

Stove shrubs, except where otherwise mentioned. Cuttings of the young shoots in spring or summer, in light, sandy soil, in a sweet hot-bed; fibry loam, leaf-mould, and peat. Winter temp., 48° to 58°; summer, 60° to 85°.

Ruins are a class of buildings beautiful as objects, expressive as characters, and peculiarly calculated to connect with their appendages into elegant groups; they may be accommodated with ease to irregularity of ground, and their disorder is improved by it; they may be intimately blended with trees and with thickets, and the interruption is an advantage, for imperfection and obscurity are their properties, and to carry the imagination to something greater than is seen, their effect.

Rui'zia. (Named after *H. Ruiz*, co-author with Pavon of the *Flora Peruviana*. Nat. ord., *Sterculiaceæ*; Tribe, *Dombeyæ*. Allied to *Dombeya*.)

Stove, white-flowered evergreens, from the Isle of Bourbon. Cuttings of half-ripened side-shoots in summer, in sandy soil, under a bell-glass, but raised at night, and in a mild hotbed; sandy loam and fibry peat. Winter temp., 50° to 55°; summer, 60° to 80°.

- R. loba'ta*. 6. 1816.
 — *variabilis*. 6. May. 1792.

Ruli'ngia. (Dedicated to *John Philip Ruling*, who wrote an essay on the Natural Order of Plants. Nat. ord., *Sterculiaceæ*; Tribe, *Buettneriæ*.)

Greenhouse shrub. For cultivation, see LASIOPETALUM.

- R. coryllifolia*. 2. White. April. Australia. B. M. t. 3182.
 — *hermanniaefolia*. 4. White. July. Australia. 1818. Syn., *Byttneria hermanniaefolia* and *Lasiopetalum dumoëum*. B. C. t. 1564.

 — *parviflora*. 1. White. W. Australia. 1868.

Ru'mex. Dock. (A name used by Pliny. Nat. ord., *Polygonaceæ*.)

R. Aceto'sa is the Sorrel. The species of this genus are known to the gardener chiefly as troublesome weeds.

Run. A plant advancing to seed is said by gardeners to have *run*. Also, when the dark colouring of a carnation, or other flower, becomes confused or clouded with its lighter ground colour, they say it is a *run flower*. Abundance of moisture and a rich soil promote the development of leaves, and, consequently, check running, or producing seed. A suitably fertile soil also preserves the colours of a flower pure and distinct; over-fertility or poverty of soil will equally cause the colours to run.

Runcinate, or **Lion-toothed**, describes the edge of a leaf cut into transverse sharp-pointed segments, pointing backwards, as in the leaf of the Dandelion.

Ru'ngia. (After *F. F. Rungia*, of Hamburg, born 1795. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*.) See **Ruellia**.
R. parviflora. See *Ruellia dependens*.

Ru'pala. See **Roupala**.

Ru'scus. Butcher's Broom. (From *bruscas*, derived from the Celtic *beus*, box and *kelem*, holly; Box Holly, or Butcher's Broom. Nat. ord., *Liliaceæ*; Tribe, *Asparageæ*.)

Hardy evergreen shrubs. Suckers, and dividing the roots; any common, rich soil. *Androgyneus* is a greenhouse evergreen climber, and like the rest of the Butcher's Brooms, retains the singularity of producing its flowers and fruits on leaf-like expansions of the stem.

Rush Lily. *Sisyrinchium*.

Russe'lia. (Named after *Dr. Russel*, author of a "Natural History of Aleppo.") Nat. ord., *Scrophulariaceæ*; Tribe, *Che-loneæ*. Allied to *Pentstemon*.)

Stove, red-flowered evergreens, from Mexico. Cuttings in sandy soil, in heat; also frequently by suckers. If a large branch is allowed to lie along the ground in a warm, moist place, plenty of plants will be made from its twigs rooting; sandy loam, peat, and leaf-mould. Winter temp., 45° to 55°; summer, 60° to 85°.

- *ternifolia.* See *R. sarmentosa*.

Rust. A disease of the berries of the grape. It appears in the form of a rough, rusty appearance of their skins, which have, in fact, become thick and hardened. Some think it arises from the berries being handled, or the hair of the head touching them; but the disease is often

too general to admit of this explanation. We believe it to arise from an over-heating and sudden reduction of temperature of the vinery whilst the grapes were young, and thus tending to force them to a premature rapidity of growth. Any excessive pressure upon the cuticle, whether from within or without, causes its thickening.

Rustic Structures are pleasing in recluse portions of the pleasure-ground, if this style be confined to the formation of either a seat or a cottage; but it is ridiculous, if complicated, and elegant forms are constructed of rude materials. Thus we have seen a flower-box, intended to be Etruscan in its outlines, formed of split hazel stakes—a combination of the rude and the refined, giving rise to separate trains of ideas totally unassociable.

Ru'ta. Rue. (From *'rus*, to flow; from some reputed medicinal virtue. Nat. ord., *Rutaceæ*; Tribe, *Rutææ*.)

Seeds in spring; also by cuttings under a hand-light in sandy soil, in a shady place, in summer. They flourish best in a deep, sandy loam, with limy rubbish mixed. See **RUE**.

- R. albiflora.* B. C. t. 1352. A synonym of *Bœninghausenia albiflora*.

Sabi'cea. (From *sabisabi*, the Indian name. Nat. ord., *Rubiaceæ*; Tribe, *Mussendeæ*. Allied to *Hamelia*.)

Stove, white-flowered, evergreen climber. Cuttings of half-ripened shoots in sand, under a glass, in heat; sandy loam, fibry peat, with silver sand and charcoal. Winter temp., 55° to 60°; summer, 60° to 88°.

S. aspera. 6. White. June. Guiana. 1824.

— *hirta.* 6. White. June. Jamaica. 1825.

Sabi'nea. (In honour of *Joseph Sabine*, *F.R.S.*, once Secretary of the Horticultural Society of London. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.)

Stove shrubs. Sandy loam, well drained.

Cuttings of young shoots in sand, under a hand-glass, in heat.

S. cardinalis. Bright scarlet. West Indies.

— *florida.* Rosy pink. West Indies.

Sac'charum. Sugar Cane. (From *soukar*, its Arabic name. Nat. ord., *Gramineæ*; Tribe, *Andropogoneæ*.)

Stove herbaceous perennials. Suckers chiefly; cuttings taken from shoots that start from the joints; rich, loamy soil. Winter temp., 55° to 60°; summer, 60° to 90°, and moist atmosphere.

S. ægyptiacum. 7. Panicle silvery, rivals Pampas Grass. Algeria. 1866.

— *Mu'nja.* 10. Benares. 1805.

Saccolo'ma. (From *sakkos*, a bag, and *loma*, a border; alluding to situa-

tion of the spores. Nat. ord., *Filices*. Allied to Davallia.)

Stove fern. See FERNS.

S. elegans. 8. Tropical America. 1860.

Sacred Bean, Egyptian. *Nelumbo speciosum* or *Nymphaea Lotus*.

Saddle Grafting. See Grafting.

Saddle Tree. *Liriodendron tulipiferum*.

Sadle'ria. (Named after Joseph Sadler, Professor of Botany at Pesth. Nat. ord., *Filices*—*Polypodiaceæ*.)

Stove ferns. For cultivation, see FERNS.

S. cyatheoides. Sandwich Islands. 1877. G. C. 1877, vii. p. 761.

Sad Tree. *Nyctanthes arbor-tri'stris*.

Safflower. *Carthamus*.

Saffron. *Crocus sativus*.

Saffron Meadow. *Colchicum*.

Saffron Thistle. *Carthamus tinctorius*.

Sage. *Salvia officinalis*.

Varieties.—The Common Green; Wormwood; Green, with variegated leaves; Red, with variegated leaves; Painted, or Parti-coloured; Spanish, or Lavender-leaved; and Red.

Soil and Situation.—A dry, moderately fertile soil is best suited to their growth, in a sheltered situation.

Propagation: by Cuttings.—These may be either of the preceding or same year's growth; if of the first, plant in April; if of the latter, not until the close of May, or middle of June. The shoots of the same year are usually employed, as they more readily emit roots, and assume a free growth. The outward and most robust shoots should be chosen, and cut from five to seven inches in length. All but the top leaves being removed, insert by the dibble almost down to these, in rows six inches apart each way, in a shady border, and during moist weather, otherwise water must be given immediately, and repeated occasionally, until they have taken root.

By Seed.—Sow in April, in a bed of rich, light earth, in drills a quarter of an inch deep, and six inches apart. When two or three inches high, thin the plants to half a foot apart, and those removed prick out at a similar distance. In the autumn or succeeding spring, as the plants are strong or weak, remove them to their final stations.

After-Culture.—The decayed flower-stalks, stunted branches, etc., remove in

early winter and spring, and turn the soil of the beds slightly over. When the plants have continued two or three years, a little dry, well-putrefied dung may be turned in during early spring. Attention to the mode of gathering has an influence in keeping the plants healthy and vigorous. The tops ought never to be cropped too close, so as to render the branches naked or stumpy.

Sage, Jerusalem. *Phlomis fruticosa*.

Sage'nia. (From *sagu*, the Malay name of some Palms, which this genus resembles in miniature. Nat. ord., *Filices*. Closely allied to *Nephrodium*.)

Stove, brownish-yellow-spored ferns. See FERNS.

S. calca'rea. June. Isle of Luzon.

— *cicutaria*. 2. Tropics. Syn., *Nephrodium cicutarium*.

— *coadunata*. 4. June. Ceylon. 1845.

— *intermedia*. June. Ceylon.

xv. p. 9.

— *mamillosa*. 2. Moluccas. 1886. Ill. Hort. t. 598.

— *platyphylla*. 3. June. Ceylon. 1845.

Sage of Bethlehem. *Pulmonaria officinalis*.

Sageretia. (After *M. Sageret*, a French agriculturist. Nat. ord., *Rhamnaceæ*.)

Stove shrub, with small greenish flowers.

S. hamosa. Green. India and Formosa.

Sage Rose. *Cistus*.

Sagina. (From *sagina*, fatness; presumed nourishing qualities for sheep. Nat. ord., *Caryophyllaceæ*; Tribe, *Alsiaceæ*.)

Insignificant weeds. *S. procumbens*, however, is one of the prettiest of our alpine plants, which makes a close carpet on the ground, spreading far and wide, and has starchy, white flowers. It is not more than half an inch high. *S. pilifera*, var. *au'rea* has golden-yellow foliage and is suitable for carpet bedding.

Sagittaria. Arrow-head. (From *sagitta*, an arrow; the leaves of some species resemble an arrow-head. Nat. ord., *Alismaceæ*; Tribe, *Alismaceæ*.)

White-flowered aquatics. Division of the plant in spring; rich, loamy soil. The greenhouse and stove kinds in an aquarium, or in vessels duly supplied with water.

STOVE AQUATICS.

S. acutifolia. 1. June. America. 1816.

— *angustifolia*. 1½. July. Essequibo. 1827. B. R. t. 1141.

Sago Palm. *Metroxylon Sa'gus*.

Sagræ'a. (Named after *Ramon de la Sagra*, a Spaniard. Nat. ord., *Melastomaceæ*; Tribe, *Miconiceæ*. Allied to *Miconia*.)

Stove evergreen shrubs. Cuttings of stubby young side-shoots in spring; sandy peat and fibry loam, with a little charcoal, and sufficient silver sand to keep the soil open. Winter temp., 48° to 60°; summer, 60° to 88°. The two following are the best:

S. hirsuta. 6. White. May. South America. 1823.

— *microphylla*. 2. White. May. Jamaica. 1820. Syn., *Ossæa microphylla*.

— *sessiliflora*. 1. Red. April. Guiana. 1793.

— *umbrosa*. 6. Red. March. South America. 1824.

Sague'rus. See *Arenga*.

Sagus. Sago Palm. (From *sagu*, the Malay name. Nat. ord., *Palmeæ*; Tribe, *Lepidocaryeæ*.)

Stove, green-flowered palms. Suckers and seeds; rich, loamy soil. Winter temp., 60°; summer 60° to 90°, and moist atmosphere.

S. Palma-Pinus. See *Raphia vinifera*.

— *pedunculata*. A synonym of *Metroxylon pedunculata*.

St. Patrick's Cabbage. *Saxi-fraga umbrosa*.

St. Peter's Wort. *A'scyrum stans*, *Hypêricum A'scyron*, *Primula officinalis*, and *Symphorica'rupus*.

Salacia. (After *Salacia*, the mythical wife of Neptune. Nat. ord., *Celastrineæ*.)

Stove shrubs, or small trees. Sandy loam. Cuttings of ripened wood, in sand, in heat under a bell-glass. See also ANTHODON.

S. prinoi' des. Greenish-yellow. June. East Indies. 1820. Syn., *Johnia coromandeliانا*. Climber.

— *pyrifor'mis*. 5. Orange-yellow. June. Upper Guinea. 1825.

— *Rozbu' rghii*. 4. Orange. June. Chittagong. 1822. Syn., *Johnia salacioides*.

Salad Burnet. *Potè'rium sanguis'orba*.

Salading. See the following:—American Cress, Beet Root, Borage, Burnet, Celeriac, Celery, Chervil, Corn Salad, Cress, Dandelion, Endive, Fenchio, Garden Rocket, Horse-radish, Lettuce, Mint, Mustard, Onions, Pursland, Radishes, Rape, Scurvy Grass, Succory, Water Cress, Wood Sorrel.

Salep. *O'rchis*.

Salisbu'ria. Maiden-hair-tree. (Named after *R. A. Salisbury*, an English botanist. Nat. ord., *Coniferæ*.) See **Ginko**.

Hardy deciduous tree. Layers, which require from one to two years to root, unless the soil be kept moist about them; cuttings of the well-ripened shoots, taken off with a heel, and inserted under hand-lights; deep, sandy loam, and dry sub-soil. This is a highly ornamental tree, producing its male and female blossoms on different trees; and it is doubtful if the female plant be in this country. The readiest way to secure fruit would be to graft female shoots on the male plant.

S. adiantifolia. Wats. Dendr. t. 168. A synonym of *Ginko biloba*. In addition to those mentioned on p. 420 there is a variety *macrophylla*.

Salisia of Lindley. (Named after the *Countess de Salis*. Nat. ord., *Myrtaceæ*; Tribe, *Leptospermeæ*. Allied to *Leptospermum*.) A synonym of **Kunzea**. This must not be confounded with *Salisia* of Regel, which is a synonym of **Gloxinia** (Nat. ord., *Gesneraceæ*).

Greenhouse evergreen shrub. Cuttings of young shoots, getting a little firm, in sand, under a bell-glass, in May; peat and loam. Winter temp., 38° to 48°.

S. pulche'lla. Rose. May. Swan River. The proper name of this is **KUNZEA SERICEA**.

Salix. Willow. (From the Celtic *sal*, near, and *lis*, water; place of growth. Nat. ord., *Salicineæ*.)

Cuttings of ripened shoots, which merely require to be inserted in the soil in the autumn; moist soil, inclining to the marshy, suits them best; very dwarf shrubs, propagating with more difficulty, should be struck in summer under a hand-light.

Salix, *Disease of*.—Small tumours often appear upon the leaves of willows. Some of these are caused by a fungus or "rust" known as *Lecythea mixta*, which grows in the internal tissue of the leaf. By its growth these tumours are formed, which at length burst and allow an orange-coloured dust to escape. This dust consists of myriads of minute pear-shaped spores or reproductive bodies. Another species, *Lecythea saliceti*, forms the tumours on the underside only of the leaves. Old trunks are often infested by larger fungi, such as: *Agaricus salignus*, *Polyporus salicinus*, *P. igniarius*, etc.

Sallow. *Salix*, especially *S. caprea*.

Sallow Thorn. *Hippophaë*.

Salmlea. (Named after the Prince *Salm Dyck*. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*. Allied to *Spilanthus*.)

Stove evergreen twiners. Cuttings of firm, stubby side-shoots in sand, under a bell-glass, in bottom-heat; rich, fibry loam. Winter temp., 48° to 58°; summer, 60° to 85°.

S. Eupatoriaria. See *S. grandiceps*.

hirsuta. 6. Yellow. August. Jamaica. 1823.
scandens. 6. Yellow. June. Vera Cruz. 1820. B. M. t. 2062. Syna. *Bidens scandens* and *Hopkirkia scandens*.

Salmon Berry. *Rubus spectabilis*.

Salpia'nthus. (From *salpinx*, a tube, or trumpet, and *anthos*, a flower; referring to the coloured calyx, which is tubular in all the plants in this order. Nat. ord., *Nyctagynææ*. Allied to the Marvel of Peru.)

Cuttings in sand, under a glass, in heat; peat and loam. Winter temp., 55° to 60°; summer, 60° to 80°.

- S. fragrans*. A synonym of *Peumus fragrans*. (Nat. ord., *Monimiacææ*.)
lancoleta. 3. Purple. June. W. Ind. 1824. Stove evergreen.
purpurascens. Variegated. June. Cuba. 1830. Stove herbaceous. A synonym of *Cryptocarpus globosus*.

Salpichlæ'na. (From *salpinx*, a tube, and *chlaina*, a cloak; the covering of the spore-cases. Nat. ord., *Filices*.) A synonym of **Blechnum**.

Stove fern. See **FERNs**.

- S. volubilis*. Yellow, brown. July. Brazil. 1842.

Salpichro'a. (From *salpinx*, a tube, and *chroa*, colour; coloured tube. Nat. ord., *Solanaceæ*; Tribe, *Solanææ*.)

Greenhouse evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass; peat and loam. Winter temp., 45° to 50°.

- S. glandulosa*. Yellow. July. Chili. 1844.

Salpiglo'ssis. (From *salpinx*, a tube, and *glossa*, a tongue; refers to the style in the tube of the flower. Nat. ord., *Solanaceæ*; Tribe, *Salpiglossideæ*.)

Annuals and biennials, from Chili; do best when sown in autumn and spring, for early spring and summer blooming. *Strami'nea*, sown in spring in a gentle hotbed, will bloom freely in summer and autumn in the greenhouse; rich, light soil.

- S. atropurpurea*. B. M. t. 2811. A form of *S. sinuata*.
Barclayana. Swt. Fl. Gard. ser. 2, t. 112. A form of *S. sinuata*.

strami'nea. B. M. t. 3365. See *S. sinuata*, var. *straminea*.

Salpiglo'phora. (From *salpinx*, a

tube, and *phora*, bearing; shape of flowers. Nat. ord., *Bignoniaceæ*.)

Greenhouse evergreen shrub. For cultivation, see *CHILOPSIS*.

S. chiloe'nsis. Crimson. Chili. 1862.

Salpixa'ntha. (From *salpinx*, a tube, and *anthos*, a flower. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*. Allied to *Ruellia*.) See **Geissomeria**.

Stove evergreen shrub. Cuttings of young shoots in spring and summer, in sandy soil, in a hotbed; loam and peat, with a little old dung, such as that from a spent mushroom-bed. Winter temp., 48° to 55°; summer, 60° to 85°.

S. coccinea. B. M. t. 4158. See *Geissomeria coccinea*.

Salsafy. *Tragopo'gon porrifolius*.

Soil.—Light and moderately fertile.

At the time of sowing trench it, turning in a little manure with the bottom-spit only.

Sow in March and April, in an open situation, in shallow drills, nine inches asunder, scatter the seeds thinly, and cover them half an inch deep. When the plants are two or three inches high, thin to ten inches asunder. During very dry weather water occasionally very plentifully, and if half an ounce of guano is added to each gallon of water it will be very beneficial. They will have large roots by September or October, when they are ready to be taken up for use; and in November, when the leaves begin to decay, a quantity may be preserved in sand for use in time of severe frost; but those left in the ground will not be injured. In spring, when those remaining in the ground begin to vegetate, the shoots, when a few inches high, may be cut and used like asparagus, being excellent when quite young and tender. Allow a few plants to run up to stalk every spring to produce seed. The best mode of cooking the roots is to boil and mash them, then form them into cakes, and fry them in butter. The flavour is that of oyster patties.

Salts. Saline manures are generally beneficial, and often essential. They ought to be put on in very small quantities, and frequently, during the time of the plant's growth.

Common Salt.—Chloride of sodium, applied in the spring at the rate of twenty bushels per acre, has been found very beneficial to asparagus, broad beans, lettuces, onions, carrots, parsnips, potatoes, and beets. Indeed, its properties are so generally useful, not only as promoting fertility, but as destroying slugs, etc., that it is a good plan to sow the whole garden every March with this manure, at the rate above specified. The flower-

garden is included in this recommendation; for some of the best practical gardeners recommend it for the Stock, Hyacinth, Amaryllis, Ixia, Anemone, Colchicum, Narcissus, Ranunculus, etc., and in the fruit-garden it has been found beneficial to almost every one of its tenants, especially the cherry and apple. On lawns and walks it helps to drive away worms and to destroy moss.

Ammonia.—The salts of ammonia are highly stimulating, and afford, by their ready decomposition, abundant food to plants. The dungs of animals are fertilizing exactly in proportion to the amount of ammonia in them. The only care required is not to apply them too abundantly. Half an ounce to each gallon of water, given at the most twice a week, is a good recipe for all the ammoniacal salts. The ammoniacal gas liquor, at the rate of one pint to two gallons of water, is highly beneficial to all plants grown for their leaves.

Chalk (Carbonate of Lime) may be applied in large quantities, twenty or thirty tons per acre, to render a light siliceous soil more retentive, or a heavy soil more open. Its basis, lime, enters into the composition of most plants in some state of combination. If the chalk is to be burnt into lime before it is applied, care should be taken that it does not contain, like some of the Yorkshire chalks, a large proportion of carbonate of magnesia. Magnesia remains long in a caustic state, and has been found injurious to the plants to which it has been applied.

Chloride of Lime gradually gives out a portion of its chlorine, and is converted into muriate of lime, a salt absorbing moisture from the air, which can hardly exist in any soil, however light, without keeping it moist; and its nauseous odour may be found to keep off the attacks of the fly and other vermin. A solution containing one ounce in five gallons of water is said to destroy the aphid and the caterpillar, if poured over the trees they infest.

Gas Lime is a hydro-sulphuret of lime, with a little ammonia. It is an excellent manure, especially to cabbages, turnips, cauliflowers, and brocoli, dug in at the time of planting or sowing. If sown over the surface at the time of inserting the crop, at the rate of twenty bushels per acre, it will effectually drive away the turnip-fly, slug, etc.

Gypsum, or Plaster of Paris, is sulphate of lime. It has been found very useful as a top-dressing to lawns, and dug in

for turnips and potatoes. Three hundred weight per acre is abundance.

Nitrate of Potash (Saltpetre), and of *Soda* (Cubic Petre), have been found beneficial to carrots, cabbages, and lawns. One pound to a square rod of ground is a sufficient quantity. Both these nitrates have been found beneficial to potatoes in Scotland. Mr. Murray says, that for very many years he has been in the habit of watering pinks and carnations with solutions of these two nitrates, and the benefit has been uniform and eminent in promoting their luxuriance.

They have also been given in solution with great benefit to chrysanthemums, lettuces, celery, fuchsias, and dahlias: one pound to twelve gallons of water. Nitrate of Soda destroys slugs.

Phosphate of Lime.—See **Bones**.

Super-Phosphate of Lime.—Chrysanthemums were much increased in vigour when watered with a solution of this salt in the Chiswick Garden at the end of July. It is thought, if the application had been made earlier, the benefit would have been still more marked.

Salt-tree. *Halimodendron*.

Saltwort. *Salsola*.

Saltwort, Black. *Glaux*.

Salvador'a. (In honour of *J. Salvador*, a Spanish botanist. Nat. ord., *Salvadoraceæ*.)

A small, stove, evergreen tree. Soil, well-drained loam. Propagated by cuttings in sand, under a bell-glass, in heat.

- *persica*. White. June. Arabia, India. 1850. Wight, Ic. t. 1621. Syns., *S. indica* and *S. Wightiana*.
- *Wightiana*. See *S. persica*.

Salvia. Sage. (From *salvo*, to save; medicinal qualities. Nat. ord., *Labiatae*; Tribe, *Monardeæ*.)

Annuals and biennials, seeds in the open border; herbaceous perennials, by division at the roots in spring; shrubs, by cuttings inserted firmly in the ground in autumn or spring, like the common Sage; greenhouse and stove species, by cuttings of the young shoots at all seasons except winter, only the stove kinds like a little heat; rich, light, good soil. See CLARY and SAGE.

Salvinia. (Named in honour of Antonio Maria Salvini, a Professor at Florence in the seventeenth century. Nat. ord., *Marsiliaceæ*.)

This pretty little floating aquatic, which like AZOLLA, is suitable for a stove, greenhouse, or indoor aquarium, is easily managed in the summer time, simply requiring to be let alone or have its water changed, if necessary; but in the winter is often lost through a want of knowledge of its life-history. The mature plant floats on the water and has no true roots, though the row of divided leaves on the under side of the stem look like roots at first sight, and assume their functions. Among these the spore capsules are developed, and from them the plant must be grown annually, as the old plants die in the winter. The best way to preserve the spores is to half fill a broad pan with sandy loam, and then fill up with water; when the water has cleared, place a number of plants upon it, and stand the pan by in a cool greenhouse; in the winter the plants will all die, but the spores will remain in the loam, which must not be thrown away or allowed to dry, and the next spring they will reproduce the plant. AZOLLA should be treated in the same manner.

S. natans. Europe, India.

Sa'mara. (From the Indian name. Nat. ord., *Myrsinææ*.) A synonym of *Myrsine*.

S. pentandra. A synonym of *Myrsine Samara*.

Sambu'cus. Elder-tree. (From *sambuke*, a musical instrument, made of elder-wood. Nat. ord., *Caprifoliaceæ*; Tribe, *Sambuceæ*.)

Hardy plants, and all white-flowered, except where otherwise mentioned. Generally by cuttings of ripened wood, either of one or several years of age. Common, rich, light soil.

HARDY HERBACEOUS.

 — *viridis*. See *S. nigra*, var. *virescens*.

Sa'mbul Plant. *Ferula Sa'mbul*.

Sa'molus. Brookweed. (From the Celtic *sau*, salutary, and *mos*, a pig; meaning pigs'-food. Nat. ord., *Primulaceæ*; Tribe, *Samolææ*.)

White-flowered herbaceous perennials. Division of the plant in spring; sandy loam and peat. *S. Valera'ndi* is hardy; the others require to be kept moist in the greenhouse or pit in winter.

S. campanuloides. 1. July. South Africa. 1816.

- *litoralis*. B. C. t. 435. See *S. repens*.
 — *repens*. 3. August. Australia. 1800. Syn., *S. litoralis*.
 — *Valera'ndi*. 3. July. Britain.

Samphire. See *Crithmum*.

Samy'da. (Greek name of the birch, which they resemble. Nat. ord., *Samydaceæ*; Tribe, *Casariææ*.)

Stove, white-flowered, evergreen shrubs. Cuttings of shoots nearly ripe in sand, under a bell-glass, and placed in bottom-heat, in summer; fibry loam, and sandy, fibry peat. Winter temp., 50° to 60°; summer, 60° to 85°.

S. glabra'ta. 6. August. W. Ind. 1800.

- *macrocarpa*. July. Mexico. 1826.
 — *macrophylla*. 5. E. Ind. 1820. Syn., *S. viridiflora*.
 — *no'bilis*. Brazil. 1866.
 — *rosea*. B. M. t. 550. See *S. serrulata*.
 — *serrulata*. 3. July. W. Ind. 1723. Andr. Rep. t. 202. Syn., *S. rosea*.
 — *viridiflora*. See *S. macrophylla*.

Sanche'zia. (In honour of Don Sanchez. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*. Syn., *Ancylogyne*.)

Stove sub-shrub. For cultivation, see BARLERIA.

S. longiflora. Vinous-purple. April. Guayaquil. 1866. Fl. Ser. t. 2460. Syn., *Ancylomyne longiflora*, B. M. t. 5588.
— *no'bitis*. Yellow, crimson. Ecuador. 1866. B. M. t. 5694. There is a variety with white-striped leaves, and another with glaucous leaves.

Sandal Wood. *Sa'ntalum*.

Sand-box-tree. *Hu'ra cre'pitans*.

Sanderso'nia. (In honour of J. Sanderson, secretary of the Natal Horticultural Society. Nat. ord., *Liliaceæ*; Tribe, *Uvulariaceæ*.)

Warm greenhouse bulb. For cultivation, see HIPPEASTRUM.

S. auranti'ca. 1½. Orange. Natal. 1852. B. M. t. 4716.

Sand Pear. *Pyrus sine'nsis*.

Sand Wood. *Bremontie'ra ammo'xylon*.

Sanguinaire Plant. *Parony'chia argen'tea*.

Sanguina'ria. Puccoon. (From *sanguis*, blood; their red juice. Nat. ord., *Papaveraceæ*; Tribe, *Eupapaver'ceæ*.)

Hardy, tuberous, white-flowered perennials, from North America. Division of the roots, or by seeds in spring; light, loamy soil.

S. canad'ensis. ½. March. N. Amer. 1680. B. M. t. 162.

— *grandifl'ora*. May, N. Amer. Swt. Fl. Gard. ser. 2, t. 147.

Sanguiso'rba. Burnet. (From *sanguis*, blood, and *sorbeo*, to absorb; supposed to be an active vulnerary. Nat. ord., *Rosaceæ*; Tribe, *Poteri'ceæ*.) This is now included in **Poterium**, under the specific names annexed.

Hardy, herbaceous perennials. Division of the roots, and by seeds in spring; common garden-soil. See BURNET.

S. alpi'na. Yellow. June. Altai. 1837. POTERIUM ALPINUM.

Sanicle. *Sani'cula europ'ca*.

Sanicle, Bear's Ear. *Cortu'sa*.

Sansevie'ra. (Named after *Sansevier*, a Swedish botanist. Nat. ord., *Hæmodoraceæ*; Tribe, *Ophiopogoniceæ*. Allied to Phormium.)

Stove herbaceous perennials, white-flowered, except where otherwise mentioned. Suckers in spring, or when obtainable, and division of the plant. Most of them require a plant-stove, or a warm greenhouse, to grow them well, and these tender ones must have little water when in a comparatively dormant state in winter; light fibry loam and vegetable mould.

S. au'rea variegata. Leaves pale green, with creamy white hands.

— *ca'rnea*. Andr. Rep. t. 361. See *Reineckea carnea*.

— *zeyla'nica*. 2. White, green. September. Ceylon. 1731.

Sa'ntalum. Sandal Wood. (From the Persian *sandul*, signifying useful. Nat. ord., *Santalaceæ*; Tribe, *Osyrideæ*.)

Stove evergreens. Cuttings of firm young shoots in sand, under a bell-glass, in heat; sandy, fibry loam and peat, with nodules of charcoal. Winter temp., 50° to 55°; summer, 60° to 85°.

S. al'bum. 10. Purple. East Indies. 1804. B. M. t. 3235.

— — *myrtifolium*. 4. Red. East Indies. 1804.

— *obtusifolium*. 5. Red. Australia. 1823.

Santoli'na. Lavender Cotton. (From *sanctus*, holy, and *linum*, flax; refers to fancied medicinal qualities. Nat. ord., *Compositæ*; Tribe, *Anthemideæ*.)

Hardy, yellow-flowered evergreens. Cuttings in autumn or spring, in a shady place; common soil.

S. alpi'na. July. South Europe. 1798.

— *can'e'scens*. July. Spain. 1683.

— *cha'mæ-cypari'ssus*. 2. July. South Europe. 1573.

— *pectina'ta*. 2. July. Spain. 1822.

— *rosmarini'folia*. 2. August. South Europe. 1683.

— *squarro'sa*. 1½. July. South Europe. 1570.

— *viridis*. 2. July. South Europe. 1727.

EXCLUDED SPECIES. —

S. anthemoides = *Lastospermum anthemoides*.

— *crithmifolia* = — *crithmifolium*.

— *er'cta* = — *pedunculare*.

— *eriosper'ma* = — *eriospermum*.

— *ri'gida* = — *rigidum*.

Sanvitalia. (Named after a Spaniard, *Sanvitali*. Nat. ord., *Compositæ*; Tribe, *Helianthoidæ*.)

Hardy annual. Seeds in a slight hotbed, in March, or in the open ground at the end of April. A trailing annual, well fitted for edgings. *S. procumbens*. 1. Yellow. July. Mexico. 1798. B. R. t. 707.

Sauari or Suwarrow Nut. *Caryocar*.

Sap is the fluid which permeates living plants. Two principal sap currents can be distinguished: 1. The ascending or crude sap, which consists of water, with various mineral matters in solution, which has been absorbed by the root-hairs. It passes up the wood vessels of the stem. 2. The descending or elaborated sap passes mainly down the bast tubes to be distributed to whatever point it may be required. In it the food materials exist in such forms as to be immediately available for building up the tissues of the plant.

Sapindus. (From *Sapo-indicus*, Indian Soap; the mucilaginous aril of the seeds is used as soap in America. Nat. ord., *Sapindaceæ*; Tribe, *Sapindæ*.)

Stove evergreen tree. Seed sown in a hotbed in spring; cuttings in sand, under a bell-glass, in heat.

S. Danu'ra. 6. White, red. May. India. 1820. Syn., *Nepheium verticillatum*.

Sapodilla or Sapotilla Plum. *Achras Sapo'ta*.

Sapona'ria. Soapwort. (From *sapo*, soap; the bruised leaves of *S. officinalis* form a lather like soap. Nat. ord., *Caryophyllaceæ*; Tribe, *Sileneæ*. Allied to *Silene*.)

S. calabrica and *ocymoides* are two of the prettiest flower-garden plants in this order. Seeds of the annuals in open border, in April; division of the perennials, and cuttings of the points of the shoots, in a sandy soil, under a hand-light; sandy loam, with a little peat or decayed vegetable earth. *S. ocymoides* and several other trailing kinds are pretty hanging over knolls or rock-works.

HARDY ANNUALS.

- S. calabrica*. ½. Rose. August. Calabria. 1830. Swt. Fl. Gard. ser. 2, t. 79.
 — *cerastoides*. ½. Pink. Russia. 1835.
 — *glutinosa*. 1. Pink. June. Tauria. 1817. Biennial. B. M. t. 2855.
 — *orientalis*. 1. Pink. July. Levant. 1732.
 — *perfoliata*. 2. Pink. June. E. Ind. 1830.
 — *porrigens*. 1. Flesh. July. Levant. 1680. Jacq. Vind. t. 109. Syn., *Gypsophila porrigens*.
 — *vaccaria*. 2. Red. July. Germany. 1596. B. M. t. 2290.
 — *viscosa*. 1. 1836.

HARDY HERBACEOUS.

- S. bellidifolia*. ½. Red. July. Italy. 1825.
 — *cæspitosa*. ½. Red. July. Pyrenees. 1820. G. C. 1881, xv., p. 501. Syn., *S. elegans*. Half-hardy.

S. elegans. See *S. cæspitosa*.

— *illyrica*. A synonym of *Tunica illyrica*.

— *lutea*. ½. Yellow. July. Switzerland. 1804.

— *ocymoides*. ½. Pink. June. France. 1768. B. M. t. 154.

— *officinalis*. 2. Pink. July. England. Eng. Bot. ed. 3, t. 197.

— *hybrida*. Pink. England.

— *prostrata*. Rose. July. Pyrenees. 1824.

Sapo'ta. (The native name. Nat. ord., *Sapotaceæ*.)

Stove evergreen tree, with milky juice. Cuttings.

S. A'chras. 50. Whitish. May. West Indies. 1731. The correct name of this is *ACHRAS SAPOTA*. B. M. t. 3111-12.

Sappan Wood. *Cæsalpinia sappan*.

Saprophyte. A plant obtaining its food from decaying organic matter (*e.g.*, most Fungi), in contrast with a *parasite*, which absorbs its nourishment from living organisms, *e.g.*, Mistletoe.

Sara'ca. (From *Sarac*, the American name. Nat. ord., *Leguminosæ*. Syn., *Jonesia*.)

Stove trees. Cuttings of ripened shoots in sand, in a brisk heat; peat and loam. Summer temp., 60° to 83°; winter, 55° to 60°.

S. inclinata. Yellowish-orange. Java and Sumatra.

— *indica*. 20. Orange. Summer. India. 1796. Syn., *Jonesia Asoca*, B. M. t. 3018, and *J. pinnata*.

— *trian'dra*. 20. Orange. E. Indies. 1820. Syn., *Jonesia scandens*.

Sara'cha. (After *Isidore Saracha*, a Benedictine monk at Madrid. Nat. ord., *Solanaceæ*.)

Greenhouse, or hardy herbs. Seeds of the hardy species sown in the open border in spring. *S. procumbens*. Yellow. Summer. Peru. Syn., *Atropa procumbens*. Jacq. H. Schoenb. t. 492.

— *stapelioides*. 1½. Pale yellow, reddish-brown. Summer. Western America. 1865. Gf. t. 465. Greenhouse.

— *umbellata*. 2-4. Cream-coloured. June. Peru. 1822. Swt. Fl. Gard. t. 85. Syn., *Atropa umbellata*.

— *viscosa*. Yellow. Summer. Western America. Swt. Fl. Gard. ser. 2, t. 323.

Sarc'anthus. (From *sarx*, flesh, and *anthos*, a flower; substance of the flowers. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Sarcantheæ*.)

Stove orchids, grown in baskets. See ORCHIDS.

S. arietinus. Greenish, rosy, yellow. Assam. 1869.

— *belophorus*. Ochre, with purplish-brown stripes. G. C. 1883, xx, p. 262.

— *chrysomelas*. Yellowish, blackish-purple. Moulmein. 1869.

— *croceus*. Saffron. Manilla. 1837.

— *erinaeus*. White, rose. Moulmein. 1867. Syn., *Aerides rubrum* and *A. dasypogon*.

— *filiformis*. Brown, yellow. July. East Indies. 1842. B. M. t. 4639.

— *flævus*. Yellowish-brown, pale yellow. Borneo. 1881.

- S. gutta'tus*. B. R. t. 1443. See *Saccolabium guttatum*.
 — *Hincksia'nus*. Green, red. 1878.
 — *la'rus*. White, purple. Moulmein. 1865. Ref. Bot. t. 109.
 — *Lendya'nus*. Greenish, purple, orange. Saigon. G. C. 1884, xxl., p. 44.
 — *ma'crodon*. Yellowish, purple. Madras. 1873.
 — *mira'bilis*. l. Yellowish. India.
 — *oxyphy'llus*. China. 1837.
 — *pa'llidus*. White. September. E. Ind. 1840.
 — *panicula'tus*. 2½. Yellow, brown. China.
 — *Pari'shii*. Yellow; lips rosy. Moulmein. 1861.
 — *præmo'reus*. See *Saccolabium papillosum*.
 — *rostra'tus*. B. R. t. 981. See *Vanda recurva*.
 — *striola'tus*. Orange, cinnamon. Philippine Islands. G. C. 1882, xviii., p. 168.
 — *succu'sus*. 1. Green. June. China. 1824. B. R. t. 1014.
 — *teretifo'lius*. l. Green, brown. May. China. 1819. B. M. t. 3571. Syn., *Vanda teretifolia*.
 — *Williamso'nii*. Amethyst. Assam. 1865.

Sarcocaulon. (From *sarx*, flesh, and *caulon*, a stem; the stems are fleshy. Nat. ord., *Geraniaceæ*; Tribe, *Geranieæ*.)

Greenhouse herbs or subshrubs. Loam, peat and half-mould mixed. Cuttings in sand under a bell-glass.

- S. Burme'nii*. 1. Purple. May. South Africa. 1800. B. M. t. 5729.
 — *Heritie'ri*. See *Monsonia Heritieri*.
 — *Paterso'ni*. See *Monsonia Patersonii*.

Sarcocephalus. Guinea Peach. (From *sarx*, flesh, and *kephale*, a head; shape and substance of the fruit. Nat. ord., *Rubiaceæ*; Tribe, *Naucleææ*.)

Cuttings in spring, in bottom-heat, under a glass. Stove evergreens, requiring a high, moist temperature when growing; sandy loam, fibry peat, with a little rough charcoal, and good drainage. Winter temp., 55° to 60°; summer, 60° to 88°.

- S. corda'tus*. 10. Yellow. May. Australia and India. 1820. Syn., *Nauclea coadrinata*.
 — *escule'ntus*. 15. Pink. July. Sierra Leone. 1822. Trans. Hort. Soc. v., p. 422, t. 18.

Sarcochilus. (From *sarx*, flesh, and *cheilos*, a lip; fleshy labellum. Nat. ord., *Orchideæ*; Tribe, *Vandæe-Sarcantheeæ*. Syn., *Ornitharium*.)

Stove orchids, grown on blocks. See ORCHIDS.

- S. calce'obus*. White. Manilla. 1844. B. R. 1846, t. 19.
 — *cochinchine'nsis*. Yellow. Cochin China. 1877. Syn., *Camarotis cochinchinensis*.
 — *falca'tus*. White. April. Australia. 1821. B. R. t. 1832.
 — *Fitzgera'ldi*. White, rose. Australia. 1877.
 — *Freema'nii*. Yellow, brown. Assam. 1875. Syn., *Thriasperrnum Freemantii*.
 — *Hartma'nii*. Creamy white, red, yellow Queensland. 1877. B. M. t. 7010. Syn., *Thriasperrnum Hartmannii*.
 — *indusia'tum*. Yellowish, with red spots; lip white. Sunda Isles. 1836. Syn., *Thriasperrnum indusiatum*.
 — *ion'o'smum*. Yellow, cinnamon-brown, red. Manilla. 1844.
 — *oliva'ceus*. Dull purple or brownish; lip white with red stripes. Australia.
 — *pa'llidus*. Pale yellow. Sylhet. Syn., *Micropera pallida*.

S. purpu'reus. Pale rose; lip rosy-crimson. India. Syn., *Camarotis purpurea*.

— *rubric'e'ntum*. Pure white with a red centre. Australia. 1880.

— *te'res*. White, violet, purple. India. Syn., *Ornitharium striatulum*, Paxt. Fl. Gard., i., p. 188, fig. 117.

— *unguicula'tus*. White, red, yellow. Manilla. 1846. Syns., *Phalenopsis Ruckeriana* and *Thriasperrnum unguiculatum*.

Sarcococca. (From *sarx*, flesh, and *kokkos*, a berry; the fruits are fleshy. Nat. ord., *Euphorbiaceæ*.)

Greenhouse, or half-hardy shrubs from the East Indies. *S. Hookeria'na* has proved hardy in the south of England. Propagated by cuttings, in sand, under a bell-glass.

S. Hookeria'na. 4. Yellowish. June. Sikkim. — *prunifo'rmis*. See *S. satignus*.

— *sati'gnus*. 4. Pale yellow. Nepal. 1820. Syn., *S. pruniformis*, B. R. t. 1012.

— *coria'cea*. 4. White. June. Nepal. 1822. Syn., *Pachysandra coriacea*.

— *latifo'lia*. A broad-leaved variety.

Sarcocolla. (From *sarx*, flesh, and *kolla*, glue; some of the species excrete a resinous matter. Nat. ord., *Penæaceæ*.)

Greenhouse shrubs from South Africa. For culture, see PENÆA.

S. imbrica'ta. 1½. Pink. June. South Africa. 1824. Syn., *Penæa imbricata*, B. M. t. 2809.

— *Linna'e'i*. 1. Red. June. South Africa. 1825. Syn., *Penæa Sarcocolla*.

— *squama'ta*. 1. Red. June. South Africa. 1787. Syn., *Penæa squamosa*, B. R. t. 106.

Sarcoglot'tis. (From *sarx*, flesh, and *glottis*, a tongue; shape of the labellum. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Spirantheæ*.) Now united with **Spiranthes**.

Stove orchids, grown in pots. (See ORCHIDS.) Some of the Neottias are by some botanists added to this section.

- S. diure'tica*. See *Spiranthes diuretica*.
 — *Esseri*. See *Spiranthes Esseri*.

Sarcolobus. (From *sarx*, flesh, and *lobus*, a pod; seed-vessel fleshy. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdenieæ*. Allied to *Pergularia*.)

Stove evergreen twiners, from the East Indies. Cuttings of short, firm side-shoots any time in summer, in sandy soil, under a bell-glass, and in a brisk bottom-heat; fibry loam and peat, with a small quantity of charcoal, dried leaf-mould, and silver sand. Winter temp., 50° to 55°; summer, 60° to 83°.

- S. carina'tus*. 16. Green, yellow. India. 1823.
 — *globo'sus*. 16. White. India. 1823. Wight. Ic. t. 1273.

Sarcopodium. (From *sarx*, flesh, and *pous*, a foot. Nat. ord., *Orchideæ*; Tribe, *Epidendræe-Dendrobieæ*.)

Stove epiphytical orchids, sometimes referred to the genera **DENDROBIUM** and **BULBOPHYLLUM**. See ORCHIDS.

- S. Che'ri*. Olive-green, brown. Manilla.
 — *Dea'rei*. Yellowish, red. G. C. 1883, xx. p. 108, fig. 17.
 — *Godseffa'num*. Yellow, brown. 1890.

- S. La'bbii*. Yellow, orange. Java.
 — *macra'nthum*. Lemon, brown. Singapore.
 — *pilea'tum*. Yellow. Singapore.
 — *psittacoglo'ssum*. Yellow, red. Moulmein.
 1833. B. M. t. 5408.

Sarcoste'mma. (From *sarx*, flesh, and *stemma*, a crown; a fleshy flower-head. Nat. ord., *Asclepiadaceæ*; Tribe, *Cynancheæ*.)

Stove evergreen twiners. Cuttings of the points of shoots in sand, under a bell-glass, and in bottom-heat; but care must be taken to raise the glass often, to prevent damping; sandy peat and fibry loam, a small portion of charcoal, leaf-mould, and sand. Winter temp., 45° to 55°; summer, 60° to 80°.

- S. Brunonia'num*. Yellow. India. 1872. B. M. t. 6002.
 — *campanula'tum*. B. R. 1846, t. 36. See *Philibertia campanulata*.
 — *Swartzia'num*. 6. White. Jamaica. 1820.
 — *vimina'le*. 6. White. July. E. Ind. 1731.

Sarge'ntia. (After Prof. C. Sprague Sargent, Director of the Arnold Arboretum, United States. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.) A synonym of **Pseudophœnix**.

S. arico'cca. A synonym of *Pseudophœnix Sargentii*.

Sarmie'nta. (Named after Mart. Sarmiento, a Spanish botanist. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

Greenhouse perennial trailer. For cultivation, see GESNERA.

- S. re'pens*. Red. Chili. 1862. Fl. Ser. t. 1646.

Sarotha'mnus. (From *saros*, broom, and *thamnus*, shrub; a shrub resembling the Broom. Nat. ord., *Leguminosæ*; Tribe, *Genisteeæ*.) See **Genista**.

S. scopar'ius Andrea'nus. See *Genista Andrea'na*.

Sarrace'nia. Side-saddle Flower. (Named after Dr. Sarrasin, a French physician. Nat. ord., *Sarraceniaceæ*.)

Half-hardy herbaceous perennials, natives of North America, but many garden hybrids have now been raised. Division in spring; fibry peat and chopped sphagnum-moss; a pit or frame will be necessary for their cultivation, to keep them from frost in winter, and to afford them a close, humid atmosphere in summer.

- S. Atkinsonia'na*. Garden hybrid.
 — *atrosangu'nea*. See *S. flava*, var. *atrosanguinea*.
 — *Catesba'i*. See *S. flava*, var. *Catesbaei*.
 — *chelsoni*. Garden hybrid between *S. rubra* and *S. purpurea*.
 — *Cou'rtii*. Garden hybrid between *S. purpurea* and *S. psittacina*.
 — *crispa'ta*. White. N. America. 1879. Perhaps a natural hybrid.
 — *de'cora*. Garden hybrid. 1889.
 — *Drummondii*. 2. Purple. June. N. Amer. 1829. Fl. Ser. t. 560. Syn., *S. undulata*.
 — — *alba*. Pitchers marked with white. Garden variety.
 — — *ru'bra*. Pitchers marked with bright red. Garden variety.
 — *exce'llens*. Hybrid between *S. variolaris* and *S. Drummondii*, var. *alba*.

S. exce'llta. Hybrid between *S. flava*, var. *atrosanguinea* and *S. Drummondii*.

- *exorna'ta*. Hybrid between *S. purpurea* and *S. crispa'ta*.
 — *Filde'sii*. See *S. flava*, var. *Catesbaei*.
 — *flava*. 2. Yellow. June. N. America. 1752. B. M. t. 780.
 — — *atrosangu'nea*. Cream-colour, yellow. N. America. 1879. Syn., *S. atrosanguinea*.
 — — *Catesba'i*. Pitchers with red veins. Syn., *S. Catesbaei*, *S. Fildesii?* and *S. flava*, var. *pieta*.
 — — *limba'ta*. Lid of pitcher edged with brownish-crimson.
 — — *ma'xima*. Pitchers large, pale green.
 — — *orna'ta*. Yellow. 1879. Syn., *S. ornata*.
 — — *pi'eta*. See *S. flava*, var. *Catesbaei*.
 — — *Willia'msii*. N. America. 1874. Syn., *S. Williamsii*.
 — *forma'sa*. Hybrid between *S. psittacina* and *S. variolaris*.
 — *illustra'ta*. Hybrid between *S. flava*, var. *pieta*, and *S. Stevensii*.
 — *Maddisonia'na*. Hybrid between *S. variolaris* and *S. psittacina*.
 — *melanorho'da*. Hybrid between *S. Stevensii* and *S. purpurea*.
 — *mi'nor*. 1. Purple, green. April. N. America. 1829. Swt. Fl. Gard. ser. 2, t. 138.
 — *Mitchellia'na*. Hybrid between *S. Drummondii*, var. *rubra*, and *S. purpurea*.
 — *Moo'rei*. Hybrid between *S. flava* and *S. Drummondii*.
 — *Pe'pet*. Hybrid between *S. flava* and *S. rubra*.
 — *porphyronex'ra*. Pitchers veined with purple. 1822.
 — *psittaci'na*. Leaves red-veined, and ends parrot-headed. American Southern States. 1866.
 — *purpu'rea*. 1. Purple. June. N. America. 1640. B. M. t. 849.
 — *ru'bra*. 1. Reddish-purple. May. N. America. 1786. B. C. t. 1163.
 — — *acumina'ta*. Pitchers with crimson veins. Syn., *S. rubra* of B. M. t. 3515.
 — *Stevensii*. Hybrid between *S. purpurea* and *S. flava*.
 — *Swania'na*. Hybrid between *S. variolaris* and *S. purpurea*.
 — *Tollia'na*. Hybrid between *S. Drummondii*, var. *alba*, and *S. flava*.
 — *undula'ta*. See *S. Drummondii*.
 — *variola'ris*. 1. Yellow. June. N. America. 1803.
 — *vitta'ta macula'ta*. Hybrid between *S. purpurea* and *S. chelsoni*.
 — *Willia'msii*. See *S. flava*, var. *Williamsii*.
 — *Wilsonia'na*. Hybrid between *S. flava* and *S. purpurea*. 1884.
 — *Wrigleya'na*. Hybrid between *S. psittacina* and *S. variolaris*.

Sa'ssafras. (From *Sassafras*, the Spanish for Saxifrage. Nat. ord., *Laurineæ*.)

Hardy, deciduous tree, from the Eastern United States. From the young shoots a kind of beer is manufactured, while the fruits yield an oil, used by perfumers. For culture, see LAURUS.

- S. officina'le*. 30. Greenish-yellow. April. Eastern United States. 1638. Bent. and Tr. t. 220. Syn., *Laurus sassafras*.

Sassafras, Californian. *Umbellularia califo'rnica*.

Sassafras, Swamp. *Magno'lia glau'ca*.

Sassafras, Tasmanian. *Antherosperma moschatum*.

Sassafras Tree. *Sassafras officinale*.

Satin Flower. *Sisyrinchium*.

Satin Moth. *Leparis*.

Satin wood Tree. *Chloroxylon Swietenia*.

Satureia. Savory. (From the Arabic *sattar*, applied to labiates. Nat. ord., *Labiatae*; Tribe, *Satureineae*.)

Seeds and divisions in spring; common, sandy loam. See SAVORY.

HARDY HERBACEOUS, ETC.

- S. hortensis*. 1½. Pink. July. Italy. 1562. Annual. Syn., *S. viminea*.
 — *molle*. ½. White. July. Teneriffe. 1829.
 — *montana*. 1½. Purple. June. South Europe. 1562. Sibth. Fl. Gr. t. 543.
 — *viminea*. See *S. hortensis*.

HARDY EVERGREENS.

- S. murtia*. June. Caucasus. 1836.
 — *spinosa*. White. May. Crete. 1827.
 — *thymbra*. 1. Purple. June. Candia. 1640. Sibth. Fl. Gr. t. 541.
 — *virgata*. Purple. June. Naples. 1424.

EXCLUDED SPECIES.

- S. approximata* = *Micromeria approximata*.
 — *capitata* = *Thymus capitatus*.
 — *congesta* = *Micromeria graeca*, var. *densiflora*.
 — *græca* = *Micromeria graeca*.
 — *hirsuta* } = *Micromeria Juliana*.
 — *Juliana* }
 — *nevosa* = *Micromeria nevosa*.
 — *repens*, Jacq. Ic. t. 494, = *Micromeria rupestris*.

Satyrium. (From *satyrus*, a satyr; supposed aphrodisiacal properties. Nat. ord., *Orchideae*; Tribe, *Ophrydeae-Diseae*.)

Terrestrial orchids, from South Africa, except *S. elatatum* and *S. nepalense*, less difficult to cultivate than their allies. We have flowered some of them planted out in a cold frame with *Ixia* and other Cape Irids. Division of the roots as fresh growth is commencing; fibry loam and turfy peat, well drained. Winter temp., 40° to 45°; summer, 55° to 75°.

- S. aureum*. Orange. August. 1842.
 — *caudatum*. White. September. 1836.
 — *caeruleum*. 1½. Pink. June. 1797.
 — *chrysoanthemum*. See *S. coriifolium*.
 — *chilatum*. Pinkish-white. August. Himalaya. 1880.
 — *coriifolium*. 1. Yellow. October. 1820. Syn., *S. cucullatum* of B. C. t. 104.
 — *cucullatum*. ½. Green. June. 1786. B. R. t. 416. Syn., *Orchis bicornis*. Andr. Rep. t. 315. *S. cucullatum* of B. C. t. 104 is a synonym of *S. coriifolium*.
 — *erectum*. 1½. Yellow. February. 1838. Maund Bot. iii., t. 117. Syn., *S. pilosum* and *S. pustulatum*, B. R. 1840, t. 18.
 — *foliosum*. Purple. July. 1828.
 — *marginaatum*. ½. June. 1789. Syn., *S. parviflorum*.
 — *membranaceum*. 1. Bright red. 1889.
 — *nepalense*. 1½. Rose-pink. Himalayas. 1882. B. M. t. 6625.
 — *papillosum*. See *S. erectum*.
 — *parviflorum*. See *S. marginatum*.

S. pustulatum. B. R. 1840, t. 15. See *S. erectum*.

Saucers made of earthenware and glazed inside are useful for standing pots in on tables, which would be damaged by a moist unprotected pot. They are now often replaced by an ornamental china pot, in which the ordinary flower-pot is completely inclosed. In either case care must be taken that the water is not too great in quantity or does not become stagnant.

Saundersia. (After *W. Wilson Saunders, F.L.S.*, an eminent cultivator of rare plants and patron of Botany. Nat. ord., *Orchideae*; Tribe, *Vandeeae-Oncidieae*.)

The sole species of this genus is a stove epiphyte.

S. mirabilis. Greenish-white, yellow, purple. Brazil. Rehb. Xen. t. 177.

Saunders Wood. *Pterocarpus santalinus*.

Saurauja. (Named after *Sauraujo*, a Portuguese botanist. Nat. ord., *Ternstroemiaceae*; Tribe, *Sauraujeae*.)

Stove evergreen, white-flowered trees and shrubs. Cuttings of ripe shoots in sand, under a bell-glass, in heat, in spring; fibry loam and sandy peat. Winter temp., 50° to 55°; summer, 60° to 80°.

- S. excelsum*. 50. Caraccas. 1820.
 — *lanceolata*. 1882.
 — *macrophylla*. Mexico. 1844.
 — *nepalense*. 30. August. Nepal. 1824.
 — *sarapiquense*. Costa Rica. 1866.
 — *spectabilis*. 10. July. Bolivia. 1838. B. M. t. 3982.

Sauroglossum. (From *saura*, a lizard, and *glossa*, a tongue; resemblance to the tongue of that reptile. Nat. ord., *Orchideae*; Tribe, *Neottieae-Spirantheae*.)

See **Spiranthes**.

S. elatum. B. R. t. 1618. See *Spiranthes elata*.

Sauromaatum. (From *saura*, a lizard; alluding to the speckled interior of the spathe. Nat. ord., *Aroideae*; Tribe, *Arineae*.)

Stove tuberous-rooted herbaceous perennials, allied to *ARUM*. Offsets. Light loam and peat in equal proportions.

- S. asperum*. See *Dracontium asperum*.
 — *guttatum*. 1½. Green, purple. May. E. Indies. 1830. Syn., *Arum venosum*, B. R. t. 1017. See also *S. venosum*.

Sauvage'sia. Iron Shrub; St. Martin's Herb. (Named after *F. B. de Sauvages*, a French botanist. Nat. ord., *Violaceæ*; Tribe, *Sauvagesiæ*.)

Pretty, tender, violet-looking annuals. Seeds in spring, in a hotbed, pricked out, and potted, and then flowered in the plant-stove or warm greenhouse.

S. ere'cta. 1. Pink or purple. May. Mexico. 1820.

— *gemini'flo'ra*. } Synonyms of *S. erecta*.

— *nu'tans*. }

Savannah Flower. *Echi'tes subere'cta*.

Savin Tree. *Juni'perus Sabi'na*.

Savory. *Sature'ia monta'na*, Winter or Perennial Savory. *S. horte'nsis*,

Summer or Annual Savory.

They may be sown in the open ground at the latter end of March or in April, in a light, rich soil; thin the seedlings moderately, and they may either remain where sown, or be transplanted. Of the Winter Savory, when the seedlings are about two inches high, it is eligible to plant out a quantity of the strongest in moist weather, in nursery rows, six inches asunder, to remain till September or spring following, then to be transplanted with balls of earth where they are finally to remain, in rows a foot asunder. When it is intended to let the Winter or Summer Savory remain where sown, the seeds may be in shallow drills, either in beds, or along the edge of any bed or border by way of an edging.

By Slips.—In the spring, or early part of summer, the Winter Savory may be increased by slips or cuttings of the young shoots or branches, five or six inches long; plant them with a dibble in any shady border, in rows six inches asunder, giving occasional waterings, and they will be well rooted by September, when they may be transplanted.

Savoy. *Bras'sica olera'cea bulla'ta major*.

Varieties.—Yellow, for Autumn; Dwarf and Green, and two sub-varieties of these, the Round and the Oval; Large Green, very hardy. These for winter-standing crops.

Sow at the close of February, the plants of which are ready for pricking out in April, and for final planting at the end of May, for use in early autumn; the sowing to be repeated about the middle of March, the plants to be pricked out in May, for planting in June, to supply the table in autumn and early winter. The main crops must be sown in April and early May, to prick out and plant, after similar intervals, for production in winter and spring.

Planting.—The plants of the first crops should be set out two feet apart each way, but the winter-standing crops are better at two feet by eighteen inches. Water abundantly, if the weather be dry, until the plants are well established.

To save Seed.—Such plants must be selected of the several varieties as are most true to their particular characteristics, and as are not the first to run. Plant these in open weather, from early in November to the close of February, entirely up to the head, in rows two feet and a half each way, each variety as far from the other as possible. They ripen their seed in July and August.

Sawdust, especially in a decayed

condition can be used as a manure, but is of little value.

Saw-Fly. See *Athalia* and *Hylotonia*.

Saws for garden-pruning must have a double row of teeth, to obviate the tendency to nip, or buckle, that the dampness of green wood and the leverage of the branch occasion. One with a very narrow blade, and on a handle six feet long, for reaching branches difficult of access, will be found convenient. The face of the wound made by a saw should always be cut smooth with the knife, and painted with tar, otherwise the wet lodging on its rough surface occasions decay. See **Bill**.

Sawwort. *Serra'tula*.

Saxe-Go'thæa. (In honour of his late *R. H. Prince Albert*. Nat. ord., *Coniferæ*; Tribe, *Podocarpeæ*.)

Half-hardy evergreen tree.

S. consp'cua. 30. June. Patagonia. 1845. Journ. Hort. Soc. vi., p. 258.

Saxi'fraga. Saxifrage. (From *saxum*, a stone, and *frango*, to break; supposed power in disease of the bladder. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifrageæ*.)

Seeds, and especially divisions in spring, unless for annuals; sandy loam; the tenderest will repay for a little leaf-mould or peat; suited best for the fronts of borders, the stumps of trees, and for knolls and rock-work.

 — *pauciflora*. Straw. July. South of Europe. 1827. Syn., *Asterocephalus pauciflorus*.

S. pteroccephala. ½. Purple. July. Greece.
 — *pube scens*. 2. White. June. Hungary. 1820.

- *pyrenaica*. 1. Purple. July. South of France. 1819. Syns., *Asterocephalus mollissimus* and *A. pyrenaticus*.
 — *rupestris*. See *S. iseticus*.
 — *rutabifolia*. 1. Scarlet. July. Sicily. 1804.
 — *Salcedi*. 1. White. June. Spain. 1823.
 — *Scopoli*. 2. Straw. July. South of Europe. 1819.
 — *setifera*. 2. White. July. France. 1826. Syn., *Asterocephalus setiferus*.
 — *silenifolia*. 1½. Red. July. Hungary. 1826.
 — *stricta*. 2. Red. June. Hungary. 1820.
 — *suaveolens*. 1. Red. July. Europe. 1836. Syn., *Asterocephalus incanus*.
 — *ucrana*. 1. Light yellow. July. Ukraine. 1795. Syn., *Asterocephalus ucranicus*.
 — *urceolata*. 3. Yellow. July. Barbary. 1804. Syn., *Asterocephalus urceolatus*.
 — *Victorica*. Garden hybrid. 1883.
 — *Webbiana*. ½. White. July. Mount Ida. 1818. Syn., *Asterocephalus Webbianus*.

Scæva. Hawk Fly. Of this genus there are several species, the most common of which are *S. ribesii* and *S. Pyrastris*. Wherever aphides are abundant, whether on the cabbage, hop, or elsewhere, there is a fleshy-green maggot. This is the larva of a hawk-fly, and should be left undisturbed, as it is a voracious destroyer of plant-lice.

Scævola. (From *scæva*, the left hand; form of the corolla. Nat. ord., *Goodeniaceæ*.)

Divisions and cuttings of young shoots; the tender species in heat; the greenhouse in a cold pit, under a bell-glass; sandy loam and turf peat; the usual greenhouse and stove treatment.

STOVE EVERGREENS.

- S. ivogfolia*. White. August. Trinidad. 1820.
 — *Konigii*. 2. Pale red. E. Ind. 1820. B. M. t. 2732.
 — *Plumieri*. 2. White. August. West Indies. 1724.
 — *Taccaida*. 2½. White. August. E. Ind. 1810.

GREENHOUSE HERBACEOUS.

- S. alterata*. Purple. June. Swan River. 1844.
 — *anhusifolia*. Blue. May. Swan River.
 — *attenuata*. 2. Pale blue. June. Swan River. 1844. B. M. t. 4196.
 — *crassifolia*. 3. White. September. Australia. 1806.
 — *cuneiformis*. 1½. Blue. Australia. 1824.
 — *fasciculata*. August. Swan River.
 — *hispidula*. 2. Lilac. July. Australia. 1827.
 — *microcarpa*. 1½. Violet. July. N. S. Wales. 1790. Syn., *Goodenia albida* and *G. levigata*. B. M. t. 287.
 — *multiflora*. Blue. July. Swan River. 1840.
 — *pilosca*. 2. Blue. May.
 — *platyphylla*. 2. White. May. 1841.
 — *suaveolens*. 2. Blue. August. N. S. Wales. 1793. Syn., *Goodenia calendulacea*. Andr. Rep., t. 22.

Scale Insect. See *Coccus*.

Scallion. See *Ciboul*.

Scammony. *Convolvulus Scammonia*.

Scaphosepalum. (From *skaphe*, a boat, and *sepalon*, a sepal; the lateral

sepals are boat-shaped. Nat. ord., *Orchideæ*; Tribe, *Epidendrææ-Pleurothallææ*.)

Greenhouse orchid.

S. antenniferum. Greenish-yellow; brown inside. G. C. 1890, vii., p. 709.

Scaphyglottis. (From *skaphe*, a boat, and *glotta*, a tongue; referring to the shape of the lip. Nat. ord., *Orchideæ*; Tribe, *Epidendrææ-Stenoglosseæ*.)

Stove epiphytal orchids. For culture, see CATTLEYA.

S. Kienastii. Brownish-green. Mexico. 1877.

Syn., *Poneria Kienastii*.

— *stellata*. Violet. Demerara.

— *violacea*. Violet. Demerara. B. M. t. 4071.

Scares are but very inefficient protection for fruits, as birds soon sit on the very branches which bear the maulkin. To frighten them effectually, it is best to employ boys for the short time scaring is required. Over seed-beds a net is the best protection; but threads tightened across the beds are very effectual.

Scarlet Runner. *Phaseolus multiflorus*.

Scelochilus. (From *skelos*, a leg, and *cheilos*, a lip. Nat. ord., *Orchideæ*; Tribe, *Vandææ-Oncidiææ*. Allied to *Comparettia*.)

Stove epiphytal orchid. See ORCHIDS.

S. Ottonis. Yellow, red. July. Caraccas. 1841.

Schæfferia. False Box. (After James Christian Schæffer, 1718-1790, a German naturalist. Nat. ord., *Celastrineæ*.)

Stove shrub. Compost of loam, sand, and peat. Cuttings in sand, under a bell-glass, in heat.

S. frutescens. 10. White. August. West Indies. 1793. Crabwood-tree.

— *lateriflora*. A synonym of *Drypetes crocea*.

Schaueria. (From Professor John Konrad Schauer, of Greifswald, 1813-1848. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.)

Stove herb. For culture, see JUSTICIA.

S. calycotricha. 2. Yellow. February. Brazil.

1824. Syns., *S. flavicoma*, *Justicia callitricha*, B. C. t. 1921, *J. calycotricha*, B. M. t. 2816, and *J. flavicoma*, B. R. t. 1027.

— *flavicoma*. See *S. calycotricha*.

Scheelea. (Dedicated to Scheele, a celebrated German chemist. Nat. ord., *Palmææ*; Tribe, *Coccolineæ*.)

Stove palm. Allied to *ATTALEA*, to which refer for cultivation.

S. excelso. 40. Venezuela. 1826.

— *imperialis*. Columbia. 1875.

— *insignis*. 50. Quito. Syn., *Maximiliana insignis*.

— *inguis*. 8.

Scheeria. (In honour of F. Scheer, Esq. Nat. ord., *Gesneraceæ*; Tribe,

Gesnerææ.) Now united with **Achimenes**.

Stove herbaceous perennial, closely allied to *Gloxinia*. For culture, see **ACHIMENES**.

S. lana'ta. 1. Purple. October. Mexico. 1856.

— *mexicana*. 3. Purple. August. Mexico.

1850. B. M. t. 4743. Now known as **ACHIMENES SCHEERII**.

Schelhammera. (Named after C. C. Schelhammer, a professor at Jena. Nat. ord., *Liliaceæ*; Tribe, *Uvulariææ*. Allied to *Uvularia*.)

Greenhouse, purple-flowered, herbaceous perennials, from Eastern Australia. Divisions: sandy loam and fibry peat; a cool greenhouse or a cold pit in winter.

S. multiflora. 1½. June. 1824. *S. multiflora* of B. C. t. 1511 is a synonym of *Kreysigia multiflora*.

— *undulata*. 1. June. 1824. B. M. t. 2712.

Schellolepis. (From *skellos*, distorted, and *lepis*, a scale. Nat. ord., *Filicesæ-Polypodiaceæ*.) Now united with **Polypodium**.

Stove, yellow-spored Indian ferns. (See **FERNS**.) There are two species, *S. amœna*, and *verrucosa* (= *Polypodium verrucosum*).

Schi'ma. (Perhaps from *schisma*, a cleft; valves of capsule cleft half-way down. Nat. ord., *Ternstroëmiaceæ*.)

Stove tree. Loam and sand. Cuttings of ripened shoots cut off at a joint, in sand, under a hand-glass in heat.

S. Noronhæ. 20. White. Hong Kong. 1824.

Syns., *S. superba* and *Gordonia javanica*.

B. M. t. 4539.

— *superba*. See *S. Noronhæ*.

Schi'nus. (The Greek name for *Pistachia lentiscus*. Nat. ord., *Anacardiææ*; Tribe, *Anacardiææ*.)

Greenhouse, green-flowered evergreens. Cuttings of ripe shoots in sand, under a bell-glass, and in a mild heat, in spring; loam and peat. Winter temp., 45°; summer, 60° to 75°.

S. dentatus. Andr. Rep. t. 620. See *Duvalia dentata*.

— *molle*. 20. August. Peru. 1597. B. M. t. 3339.

— *terebinthifolia*. 20. Brazil. 1829.

— *virgata*. 8. June. Lima. 1822.

Schismatoglossis. (From *schisma*, deciduous, and *glotta*, a tongue; because the limb of the spathe falls off very quickly. Nat. ord., *Aroideæ*; Tribe, *Philodendrææ*.)

Stove perennial herbs, of dwarf stature, with variegated leaves. All are natives of the Indian Archipelago. Divisions. Rich sandy loam, fibry peat, and leaf-mould, in equal proportions, well drained; they require a moist atmosphere, and plenty of water with shade. Summer temp., 70° to 85°; winter, 60° to 70°.

S. crispa'ta. Leaves dark green, with a broad central greyish band. Green, creamy white. Borneo. 1881. B. M. t. 6576.

— *de'cora*. See *S. pulchra*.

— *latifolia*. See *S. rupestris*.

— *Lava'llei*. Leaves bright green, blotched with grey above, pale green below. Java. Syn., *Aglaonema Lavalletii*. Ill. Hort. t. 418.

- S. Lavallei immaculata*. Leaves bright green above, not spotted, purple below. Java. 1882. Syn., *S. Lavallei*, var. *Lansbergiana*.
- *Lansbergiana*. Ill. Hort. t. 468. See *S. Lavallei*, var. *immaculata*.
- *purpurea*. Leaves bright and blotched with grey above, deep purple beneath. Sumatra. 1882.
- *longispatha*. Yellowish-green. Leaves light green, feathered with silvery-grey along the midrib. Borneo. 1881.
- *neoguineensis*. Pale green. Leaves bright green, with yellowish-green blotches. New Guinea. 1879. Syn., *Colocasia neoguineensis*. Ill. Hort. t. 380.
- *picta*. $\frac{3}{4}$. Whitish. Leaves with a feathered greyish band down the middle. Borneo. 1864.
- *pulchra*. Leaves glaucous green above. Borneo. 1884. Ill. Hort. t. 520. Syn., *S. decora*.
- *rupesstris*. Yellow. Java. 1882. Syn., *S. latifolia*.
- *siamensis*. Leaves glossy-green, with white spots. Siam. 1884.
- *variegata*. $\frac{3}{4}$. White leaves nearly as in *S. picta*. Borneo. 1862.

Schivereckia. (Named after A. Schiureck, a Russian botanist. Nat. ord., *Cruciferae*; Tribe, *Alyssineae*.) Now united to **Alyssum**.

Hardy herbaceous. Divisions; common garden-sol.

- S. podolica*. $\frac{1}{2}$. Yellow. June. Podolia. 1821. B. C. t. 1720. The correct name of this is **ALYSSUM PODOLICUM**.

Schizæa. (From *schizo*, to cleave, or cut; the appearance of the fan-like fronds. Nat. ord., *Filices-Osmundaceae*.)

Curious ferns, with narrow fronds usually branched in a dichotomous manner. See **FERNS**.

GREENHOUSE FERNS.

- S. bifida*. $\frac{1}{2}$. June. Australia. 1822.
- *pustilla*. $\frac{1}{4}$. June. N. Amer.
- *rupesstris*. $\frac{3}{4}$. June. Australia. 1822.

STOVE FERNS.

- S. dichotoma*. 1. W. Indies.
- *digitata*. 1. Malay Islands.
- *elegans*. $\frac{3}{4}$. June. Trinidad. 1819.
- *latifolia*. 1 $\frac{1}{2}$ to 3. W. Indies. 1861.
- *penicillata*. See *S. pennula*.
- *pennula*. 1. S. America. 1816. Syn., *S. penicillata*.
- *propinqua*. April. Malacca.

Schizandra. (From *schizo*, to cut, and *aner*, the male organ; split stamens. Nat. ord., *Magnoliaceae*; Tribe, *Schizandreae*.)

Cuttings of ripe shoots in sand, under a bell-glass, and kept only a little higher than the temperature of a cold pit or green-house; sandy, fibry loam, and a little leaf-mould. Winter temp., 40° to 45°. *S. coccinea* lived several years against the conservatory wall at Chiswick.

- S. chinensis*. 20. Pale rose. Summer. N. China. 1860.
- *coccinea*. Scarlet. June. N. Amer. 1806. B. M. t. 1413.
- *marmorata*. Borneo. 1860. Syn., *Sphaerostema marmoratum*. Stove climber.
- *propinqua*. 8. Pale yellow. July. Nepal. 1828. Syn., *Sphaerostema propinquum*. B. M. t. 4614. Stove.

Schizanthus. (From *schizo*, to cut, and *anthos*, a flower; the petals cut into fringes. Nat. ord., *Solanaceae*; Tribe, *Salpiglossideae*.)

Seeds in autumn, to be kept in a greenhouse, for early blooming; seeds in a slight hotbed, in March, for successive blooming in pots, and early blooming out of doors; seed in the open air in the end of April. Beautiful annuals, fitted either for pot or border culture; rich, light, fibry loam; when kept over the winter, the soil should be poor, and the plants near the glass.

- S. caendicus*. 2. White. Coquimbo. 1843. B. R. 1843, t. 45.
- *Evansianus*. Paxt. Mag. viii. p. 171. See *S. pinnatus*.
- *Grahami*. 2. Variegated. August. Chili. 1831. B. M. t. 3044.
- *ilicifolius*. Lilac, golden-yellow, veins brown. Garden variety. Gh. 1887, p. 665, fig. 169.
- *retusus*. 2. Variegated. August. Chili. 1831. Syn., *S. retusus*. B. M. t. 3044.
- *Hookeri*. 2. Rose, lilac. August. Chili. 1828. B. M. t. 3070.
- *incaicus*. 1. White, yellow. 1852. Belg. Hort. ii. t. 6.
- *pinnatifidus*. 2. Various. May. Coquimbo. 1841.
- *pinnatus*. 2. White, purple. August. Chili. 1822. Syn., *S. Evansianus* and *S. Priestii*.
- *humilis*. 1. Crimson. July. Valparaiso. 1831.
- *porrigens*. 2. Crimson. August. Chili. 1822. B. M. t. 2521.
- *Priestii*. Paxt. Mag. i. t. 31. See *S. pinnatus*.
- *retusus*. See *S. Grahami*, var. *retusus*.
- *violaceus*. 3. Purple. August. Chili. 1853.

Schizobaësis. (From *schizo*, to cut, and *basis*, the base; because the withered corolla separates at its base from the receptacle, and is pushed off by the swelling fruit in the form of a calyptra. Nat. ord., *Liliaceae*; Tribe, *Asphodeleae*. Allied to *Bowiea*.)

Greenhouse bulb. Seeds; offsets. Light loam; place in full sunshine. Summer temp., 60° to 80°; winter, 45° to 55°.

- S. intricata*. $\frac{3}{4}$. White, green. S. Africa. 1875.

Schizocæna. (From *schizo*, to cut, and *kainos*, unusual. Nat. ord., *Filices*.) A synonym of **Cyathea**.

Stove fern. See **FERNS**.

- S. Brunonis*. A synonym of *Cyathea Brunonis*.
- *sinuata*. A synonym of *Cyathea sinuata*.

Schizocæsia. (From *schizo*, to split, and *Casia*, a plant with divided leaves, allied to *Colocasia*. Nat. ord., *Aroidae*; Tribe, *Colocasiæ*. Very closely allied to *Alcacia*.)

Stove, herbaceous aroids. For culture, see **ALCASCIA**.

- S. Portei*. Philippine Islands. 1862.
- *Regnierii*. Leaves dark green, with whitish-green midrib and nerves. Siam. 1887. Ill. Hort. xxxiv. t. 6.

Schizolobium. (From *schizo*, to split, and *lobos*, a little pod; probably

in reference to the dehiscence of the pod. Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpinieæ*.)

Stove evergreen tree. For cultivation, see POINCIANA, to which it is allied.
S. excelsum. Yellow. Brazil. 1874.

Schizoloma. (From *schizo*, to cut, and *loma*, an edge; edges of fronds cut. Nat. ord., *Filices*.) A synonym of **Lindsaya**.

Brownish-yellow-spored stove ferns. See FERNS.

S. ensifolia. May. Malacca. A synonym of *Lindsaya ensifolia*.
 — *heterophylla*. May. Isle of Luzon. A synonym of *Lindsaya heterophylla*.

Schizome'ria. (From *schizo*, to cut, and *meros*, a part; cut petals. Nat. ord., *Saxifragaceæ*; Tribe, *Cunoniææ*. Allied to *Weinmannia*.)

Greenhouse evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass, in spring; loam and peat, with silver sand and charcoal. Winter temp., 40° to 48°.
S. ovata. 8. White. Australia. 1825.

Schizopetalon. (From *schizo*, to cut, and *petalon*, a petal. Nat. ord., *Cruciferae*; Tribe, *Sisymbriææ*.)

Seeds in a slight hotbed in March, pricked out into pots, and grown in an airy greenhouse, or transplanted to the front of borders in May; sandy loam and leaf-mould; if in a pot, add a little peat.

S. Walkeri. 2. White. June. Chili. 1822.
 B. M. t. 2379.

Schizophragma. (From *schizo*, to cut, and *phragma*, an inclosure or wall; because the portions of the wall between the ribs of the fruit fall away when it is ripe. Nat. ord., *Saxifragaceæ*; Tribe, *Hydrangeææ*. Allied to *Hydrangea*.)

Greenhouse shrub. Seeds; cuttings in sand, under a bell-glass, in a slight bottom heat. Fibry loam and leaf-mould. Ordinary greenhouse treatment.

S. hydrangeoides. White or flesh-coloured. Japan. 1879. Rev. Hort. 1881, p. 313.

Schizostylis. (From *schizo*, to cut, and *stylos*, a column. Nat. ord., *Iridææ*; Tribe, *Ixiææ*.)

For cultivation, see LIBERTIA.

S. coccinea. 3. Crimson. Kaffraria. 1864. B. M. t. 5422. Half-hardy bulb.

Schlimia. (In compliment to M. Schlim, one of M. Linden's plant collectors. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Maxillariææ*.)

Stove epiphytal orchids. See ORCHIDS.

S. jasminodora. White. Central America. 1852.
 — *trifida*. White, purplish, orange. Columbia. 1876.

Schlumbergeria. (Named after F. Schlumberger, a Belgian horticulturist. Nat. ord., *Bromeliæææ*.)

Stove perennials. For cultivation, see TILLANDSIA.

S. Lindenii. Belg. Hort. 1883, p. 121, tt. 10-12.

See *Caraguata Lindenii*.

— *Morreniana*. Belg. Hort. 1883, p. 46, tt. 4-6.

See *Caraguata Schlumbergii*.

— *Roezii*. 3. White and greenish. Andes of Peru. 1879.

— *viridescens*. 2. Pale yellowish-green. March. Columbia. 1857. Syns., *Puya virescens*, *Anoplophytum vittatum*, *A. stramineum*, and *Tillandsia vittata*.

Schmidelia. (Named after C. C. Schmidel, a German botanist. Nat. ord., *Sapindaceææ*; Tribe, *Sapindæææ*; Syn., *Ornitropeææ*.)

Stove, white-flowered evergreens. Cuttings of ripe shoots in sand, under a bell-glass, in the beginning of summer, and placed in a mild bottom-heat; sandy loam and fibry peat. Winter temp., 50° to 60°; summer, 60° to 85°.

S. comita. 20. Jamaica. 1778.

— *integrifolia*. Bourbon. 1804.

— *occidentalis*. 8. W. Ind. 1828.

— *racemosa*. 15. May. E. Ind. 1820.

— *serrata*. 12. E. Ind. 1804.

Schœnia. (In honour of Dr. Schœn, a botanical artist. Nat. ord., *Compositææ*; Tribe, *Inuloideææ*. Allied to *Pteropogon* and *Helichrysum*.)

A tender annual. Sow end of March in moderate heat; transplant seedlings into small pots in same heat; plant four or five in an eight-inch pot; gradually harden; and when in flower place in greenhouse.

S. oppositifolia. 1. Pink. May. Swan River. 1846. B. M. t. 4560. Syn., *S. Cassiniana*.

Schœffia. (In honour of John Schœff, a German botanist. Nat. ord., *Olacineææ*.)

Stove, or greenhouse shrub. Propagated by cuttings in sand, under a bell-glass, in heat.

S. fragrans. 15. Pale yellow. June. Nepal. 1827.

Schomburgkia. (Named after Sir R. Schomburgk. Nat. ord., *Orchidæææ*; Tribe, *Epidendrææ-Laliæææ*. Allied to *Catleya*.)

Stove orchids, grown on blocks. See ORCHIDS.

S. chionodora. 1. White, with purple spots. Central America. 1886.

— *Kimballiana*. Light purple. 1888.

— *crispa*. 3. Yellow, brown, pink. January. La Guayra. 1844.

— *grandiflora*. See *S. tibicinis*, var. *grandiflora*.

— *Humboldtii*. 1. Pale lilac, purple; lip amethyst purple, yellow. Venezuela.

— *limpidissima*. 3. Purple. G. C. 1889, v. p. 72.

— *Lyonstii*. 3. White, marked with purple; lip white, yellow. August. Jamaica. 1853. B. M. t. 5172.

— *marginata*. 1½. Brick-red; lip white, pink, yellow. August. Surinam. 1838. B. M. t. 3729.

— *immarginata*. Brownish, margin not yellow; lip white. G. C. 1887, i. p. 447.

— *rosea*. Deep red, pale rose. Sierra Nevada.

— *Sanderaiana*. Rosy carmine. February. G. C. 1891, ix. p. 202.

— *Thomsoniana*. Light yellow, mauve, white; 3 L

lip blackish-purple, white, yellow. 1887. Syn., *Bletia Thomsoniana*.

S. tibiciniæ. 8. Pink, white. April. Honduras. 1834.

— *grandiflora*. 5. Brown, rose. May. Honduras. 1844. Syn., *S. grandiflora*. B. M. t. 4476.

— *undulata*. Purple. January. La Guayra. 1843. Syns., *S. violacea* and *Bletia undulata*. B. E. 1845, t. 53.

Scho'tia. (Named after R. V. Schot, who travelled with Jacquin. Nat. ord., *Leguminosæ*; Tribe, *Amherstieæ*. Allied to *Amherstia*.)

Greenhouse evergreen shrubs, from South Africa. Cuttings of half-ripened, young, stubby shoots in sand, under a bell-glass; sandy peat and fibry loam; flowers chiefly at the end of stiff young shoots.

S. alata. 5. Crimson. July. 1816.

— *latifolia*. Purple, white. June. 1810.

— *simplicifolia*. Red. June. 1816. Syn., *Bandeiræa simplicifolia*.

— *speciosa*. 5. Scarlet. August. 1759. Jacq. Ic. t. 75; Andr. Rep. t. 348.

— *stipulata*. 5. Crimson. July. 1794.

— *timarinifolia*. 6. Crimson. August. 1795. B. M. t. 1153.

Schousboë'a. (Named after P. K. A. Schousboe, once Danish consul in Morocco. Nat. ord., *Combretaceæ*.) A synonym of **Cacocua**.

S. coccinea. A synonym of *Cacocua coccinea*.

Schouw'ia. (Named after J. F. Schouw, a Danish botanist. Nat. ord., *Cruciferae*; Tribe, *Lepidieæ*.)

Hardy annual. Seeds in light, sandy soil, in April.

S. arabica. 3. Purple. June. Arabia. 1837. Ic. Pl. t. 223.

Schra'dera. (After Henry Adolf Schrader, 1767-1836, a German botanist. Nat. ord., *Rubiaceæ*.)

Stove, sub-epiphytal shrubs. Compost of sandy loam and peat. Cuttings in sand, under a bell-glass, in heat.

S. cephalotes. 4. White. July. Jamaica. 1820.

Schra'nkia. (Named after F. P. Schrank, a German botanist. Nat. ord., *Leguminosæ*; Tribe, *Eumimoseæ*. Allied to *Mimosa*.)

The leaves yield to the touch like those of the sensitive plant—*Mimosa pudica*. Herbaceous plants. Division of the roots in spring, and cuttings of the young shoots in spring in sandy soil, under a bell-glass, and a little bottom-heat; sandy loam and fibry peat. Plant-stove and cool greenhouse treatment.

S. aculeata. 2. Red. July. Vera Cruz. 1738. Stove.

— *leptocarpa*. Rose. July. St. Domingo. 1837. Stove.

— *uncinata*. 2. Red. July. N. Amer. 1789. Greenhouse.

Schre'bera albens. A synonym of **Elæodendron pedunculatum**.

Schube'rtia. (Named after M. Schubert, a Polish botanist. Nat. ord., *Asclepiadaceæ*; Tribe, *Cynancheæ*.)

Stove evergreen twiners, from Brazil. Cuttings

of stubby side-shoots in sand, under a bell-glass, in bottom-heat; sandy loam, fibry peat, and a little charcoal and pounded bricks, with pots well drained. Winter temp., 50° to 55°; summer, 60° to 85°.

S. auricoma, *S. Gra'hams*, *S. grandiflora*, and *S. graveolens* (B. R. 1846, t. 21) are all forms of *Araxia graveolens*.

— *capensis*. A synonym of *Widdringtonia juniperoides*.

— *disticha*. See *Taxodium distichum*.

Schwægriche'nia. (After Dr. Schwægrichen, an eminent bryologist. Nat. ord., *Hæmodoraceæ*.) A synonym of **Anigosanthos**.

S. flavida. A synonym of *Anigosanthos flavida*.

Schwa'nnia. (After Theodor Schwann, a physician at Bonn. Nat. ord., *Malpighiaceæ*. Syn., *Fimbriaria*.)

Stove evergreen, climbing shrub. Loam, leaf-mould and sand. Cuttings.

S. elegans. Red. June. Brazil. 1842.

Schweigge'ria. (Named after Professor Schweigger, a German botanist. Nat. ord., *Violaceæ*.)

Stove evergreen. Cuttings of firm side-shoots, two or three inches in length, in sand, under a bell-glass, in May, and in a sweet hotbed. Winter temp., 50° to 55°; summer, 60° to 85°.

S. pauciflora. White. May. Brazil. 1838. B. R. 1841, t. 40.

Sciado'calyx. (From *scias*, a parasol, and *calyx*; alluding to the shape of this part of the flower. Nat. ord., *Gesneraceæ*.) Now united with **Isoloma**.

This is a very gay stove plant, blooming from July to January. Cultivated like **ACHIMENES**.

S. Warszewiczii. 3. Scarlet, yellow. New Grenada Mountains. 1855. B. M. t. 4843.

A synonym of **ISOLOMA WARSZEWICZII**.

Sciadophyllum. (From *sciades*, shady, and *phyllon*, a leaf; the large leaves afford much shade. Nat. ord., *Araliaceæ*. Allied to the Ivy.)

Stove evergreens. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat, in spring; sandy loam and fibry peat. Winter temp., 50° to 55°; summer, 60° to 80°. The Peruvian species will thrive well in a greenhouse with 10° less.

S. acuminatum. 10. Yellow. Peru. Climber. — *anomalum*. 20. White. Green. Trinidad. 1817.

— *Bromii*. 20. White. Jamaica. 1793.

— *conicum*. 10. Pale red. Peru. Climber.

— *digitatum*. 10. Green. E. Ind. 1820.

— *pedicellatum*. 10. Purple. Peru. Climber.

— *pentanarum*. 8. Pale red. Peru. 1820.

Sciado'pitys. (From *scias*, a parasol, and *pitys*, a fir tree; referring to the spreading whorls of leaves. Nat. ord., *Coniferae*; Tribe, *Araucarieæ*.)

Hardy evergreen. Imported seed. Rich light loam.

S. verticillata. 140. Japan. 1861. Fl. Ser. t. 1483.

— *variegata*. Some of the leaves are pale yellow. Garden variety. 1887.

Sci'ara. S. py'ri. Small Pear Midge. *S. Schmidbe'rgeri*, Large Pear Midge. When a fallen pear is cut open, it is often found core-eaten, and with a brown powder marking the progress of the assailant. This is caused by the larva of these insects. The midges appear early in July. The Small Pear Midge has club-shaped halteres, the club dark brown, and the stem whitish. When alive, the abdomen is of a lead colour, with black wings. The head and thorax are black, as also are the antennæ; the palpi are of a pale yellow, the feet whitish, and the tarsi black.

The *Large Pear Midge* appears about the same time as the preceding. The female is little more than a line long, and half a line thick, also much larger than the smaller pear midge; the male is more slender, and somewhat shorter. The antennæ are blackish, and not so long as the body. The head is black and shining, as is also the thorax; the proboscis ashy-grey, the abdomen of the male a deep black, that of the female browner, with black wings; the anal point, however, is quite black, the feet ashy-grey, and the tarsi and wings black. They both survive the winter, and deposit their eggs in the blossom, when it opens in early spring. The larva eats its way into the core of the young fruit, and again eats its way out at one side when the time arrives for it to bury itself in the ground, and pass into the chrysalis form.—*Kollar*.

Sci'lla. Squill. (From *skyllo*, to injure; the bulbs said to be poisonous. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*.)

Offsets; light, sandy soil.

GREENHOUSE BULBS.

Scindapsus. (From *skindapsos*, an ancient name for an Ivy-like climber. Nat. ord., *Aroidæ*; Tribe, *Callicæ*.) Allied to *Raphidophora*.)

Stove evergreen climbers, requiring the same treatment as *MONSTERA*, *RAPHIDOPHORA*, or *PHILODENDRON*.

S. andromeda. Young leaves entire, those produced later divided. Rev. Hort. 1884, p. 536, fig. 114.

- S. argy'rea*. Borneo. 1859. Syn., *Pothos argyrea*.
 — *officina'lis*. 4. Green, dull yellow. May. India. 1820.
 — *peru'sa*. Rev. Hort. 1883, p. 561, fig. 111. The plant here figured is *Monstera deliciosa*.
 — *pi'cta*. Leaves dark green and clouded above, pale green beneath. Java.

Sciadophyllum. See **Sciadophyllum**.

Scion. See **Graff**.

Scirpus. Rush. (A name used by classical writers for the Rush. Nat. ord., *Cyperaceæ*; Tribe, *Scirpeæ*.)

A large genus of marsh plants. The species in cultivation are hardy, or half-hardy perennials.

- S. Holoschoenus variegatus*. 1 $\frac{1}{2}$. Green. Seashores of Europe.
 — *lacu'stris*. 1-8. Reddish-brown. July. Northern Europe.
 — *ripa'rius*. Brownish. Extra-tropical regions. Syn., *Isolepis gracilis*.
 — *seta'ceus*. $\frac{1}{2}$. Green, brown. July. Britain. Eng. Bot. ed. 3, t. 1594. Syn., *Isolepis setaceus*.
 — *Tabernaemontani zebrina*. 2-3. Japan. 1881. Syn., *Juncus zebrinus*. The leaves are terete and banded with green and white, in a similar manner to a porcupine's quill, hence the name—Banded Rush.

Scissors of various sizes are required by the gardener. A pair with very sharp and pointed blades is required for cutting away the anthers of flowers in hybridizing, and for thinning grapes. Stouter pairs are used for removing

flower-stalks when the petals have fallen from roses, etc. Sliding pruning scissors (see fig.) are employed for cutting the shoots of shrubs. They are powerful instruments for the purpose; but a more simple pair, without a spring, is made.

Shears are only large scissors. *Hedge Shears* for clipping hedges are the most common, and are now made with a notch in one of the blades near the rivet, to act as a fulcrum when cutting the larger branches. *Sliding Pruning Shears*, with a movable centre, so as to make a drawing cut when used as when the pruning knife is employed. See **Averuncator**.

The drawing shows the smaller size,

used with one hand. The large size, which has wooden handles, will, when employed with both hands, cut through a bough full three inches in circumference with the greatest ease.

Verge Shears are merely the hedge shears set nearly at a right angle on long handles, for the convenience of the gardener in clipping the sides of box-edging and the verge of grass-plots. *Turf Shears* are set also at an angle, but in a different direction, for cutting the tops of edgings, and grass growing in corners unapproachable by the scythe.

Scla'rea. (From the Italian *schia'rea*, clear; the flowers of the common species are of a clear blue colour. Nat. ord., *Labiatae*; Tribe, *Monardeæ*.) A synonym of **Salvia**.

Scleria. (From *skleria*, hardness; the character of the nutlet. Nat. ord., *Cyperaceæ*; Tribe, *Scirpeæ*.)

Hardy marsh herbs, requiring the same culture as **SCRIPUS**.

S. ciliata. 2. June. Southern United States.

1823.

— *verticillata*. 1. June. North America.

1825.

Scler'oon. (From *scleros*, hard, and *oon*, an egg; hard seeds. Nat. ord., *Verbenaceæ*; Tribe, *Viticeæ*. Allied to *Cornutia*.) Now united with **Petitia**.

Greenhouse evergreen. Cuttings of young shoots in sand, under a bell-glass, in spring; peat, loam, and leaf-mould, and half a part of silver sand. Winter temp., 38° to 48°; summer, 60° to 75°.

S. oleinum. 2. Green, white. May. Mexico. 1840. The correct name of this is **PETITIA OLEINA**.

Sclerotha'mnus. (From *scleros*, hard, or rigid, and *thamnus*, a shrub. Nat. ord., *Leguminosæ*; Tribe, *Podalyriæ*. Allied to *Pultenæa*.) A synonym of **Eutaxia**.

Greenhouse evergreen. Cuttings of stiff side-shoots in April or May, in sand, under a bell-glass; two parts peat, and one part of sandy, fibry loam, and one of equal parts broken bricks, charcoal, and silver sand. Winter temp., 40° to 48°.

S. microphyllus. 2. Yellow. May. Australia. 1803. A synonym of **EUTAXIA MICROPHYLLA**.

Scolope'ndrium. Hart's Tongue. (From *scolopendra*, a centipede; the appearance of the seed, or spore-cases. Nat. ord., *Filices*.)

Hardy or greenhouse brown-spored ferns. See **FERNs**.

S. Hemionitis. 1. August. Spain. 1779.

— *Krebitii*. A synonym of *Lomaria punctulata*.

— *officinatum*. See *S. vulgare*.

— *palma'tum*. See *S. Hemionitis*.

— *pinna'tum*. 1. May. India. Greenhouse.

— *rhizophyllum*. May. North America. Syn., *Antigramma rhizophylla* and *Campotossurus rhizophyllum*. Greenhouse.

S. vulgare. 1½. Europe. Syn., *S. officinarum*. Hart's tongue. The forms of this are extremely numerous.

— *acrocila'don*. Fronds narrow, branched and crested.

— *angustifolium*. ½. July. Britain.

— *claphamii*. Fronds forked, crested; edges lacinate.

— *columnna're*. ½. Fronds fringed.

— *Coolidgei*. ½. Fronds very much branched, and forming an almost spherical plant.

— *crispum*. 1½. July. Britain.

— *cristatum*. Fronds branched and expanded upwards.

— *densum*. ½. Resembling curled parsley. 1882.

— *Kelewa'yi*. 1880.

— *laceratum*. Much crested and curled at the tips.

— *marginatum*. 1. Margins of frond thickened beneath and often with projecting points.

— *multifidum*. 1½. July. Britain.

— *ramo-marginatum*. Intermediate between the varieties *cristatum* and *marginatum*.

— *ramosum*. 1½. July. Britain.

— *Stansfieldii*. Fronds fringed at the edge and crested at the tips.

— *undulatum*. 1½. July. Britain.

— *Valloisii*. Fronds dilated and crested at their tips. Rev. Hort. 1886, p. 447, fig. 114.

Scoly'mus. Golden Thistle. (From *skolos*, a thorn; plants spiny. Nat. ord., *Compositæ*; Tribe, *Cichoriaceæ*. Allied to *Chichory*.)

Hardy, yellow-flowered plants. Seeds and divisions in spring; common garden-soil.

S. grandiflorus. 3. May. Barbary. 1820.

Herbaceous.

— *hispanicus*. 3. August. South Europe.

1658. Herbaceous. Sibth. Fl. Gr. t. 825.

— *maculatus*. 3. July. South Europe. 1633.

Annual. Sibth. Fl. Gr. t. 824.

Scolytus. A genus of small beetles, very nearly allied to *Bostrichus*. *S. destructor* attacks the Elm; *S. ligniperda* the bark of some of the Conifers; and *S. crenatus* perforates, in a similar manner, the wood of the Plum. They do not, however, confine their ravages to the trees we have named. They are not more than an eighth of an inch long, black, with chestnut-coloured legs, and sprinkled over with bristles.

Scopo'lia. (Named after *G. A. Scopoli*, a foreign botanist. Nat. ord., *Solanaceæ*; Tribe, *Hyoscyameæ*. Allied to *Physalis*.)

Hardy herbaceous. Division of the roots in spring, or sowing the seeds in a slight hotbed; sandy loam, and a dry situation.

S. aculeata. See *Toddalia aculeata*.

— *carniolica*. 1. Dark purple. April. Car.

nola. 1780. Syn., *S. atropoides* and

Hyoscyamus Scopolia. B. M. t. 1126.

— *lu'rida*. 5. Green, changing to yellowish, then to purple. Nepal. 1824. Syn., *Whitleya stramonifolia*. Swt. Fl. Gard. t. 125.

— *mutica*. 1½. Yellow. May. Egypt. 1829. Syn., *Hyoscyamus datora*. Half-hardy evergreen.

Scorching, or **Burning**, describes the drying up of the roots or of the leaves from exposure to too much heat. The preventive, in the first case, is reducing the temperature of the hotbed, or lifting the pots if the plants are so grown; in the second case, as it always arises from the sun's rays in the confined air of a house. Hartley's rough glass, and early ventilating, are the preventives.

Scorodo'sma. (From *schorodon*, garlic, and *osme*, smell. Nat. ord., *Umbelliferæ*; Tribe, *Peucedaneæ*.) A synonym of **Ferula**.

S. foetidum. Wien. Gart. 1838, p. 74, fig. 13. A synonym of *Ferula asafetida*.

Scorpion Grass. *Myosotis*.

Scorpion Senna. *Coronilla emerus*.

Scorzone'ra. Viper's Grass. (From *scurson*, a viper; supposed remedy for the bite of a viper. Nat. ord., *Compositæ*; Tribe, *Cichoriaceæ*. Syn., *Podospermum*.)

Hardy herbaceous; yellow-flowered, except where otherwise stated. Seeds in April or May; common garden-soil.

S. angustifolia. ½. July. South Europe. 1759.

— *austriaca.* 1. August. Europe. 1597.

Syn., *S. humilis*.

— *calcitrapifolia.* 1. June. Levant. 1820.

Sibth. Fl. Gr. t. 787. Syn., *Podospermum*

calcitrapifolium.

— *caricifolia.* 1½. July. Siberia. 1805.

— *ensiifolia.* ½. May. Caucasus. 1825.

— *eriosperma.* 1. August. Italy. 1816. Syn.,

Lastospermum eriospermum. Half-hardy.

— *glastifolia.* 2. July. Germany. 1816.

— *graminisifolia.* 2. July. Portugal. 1759.

Sibth. Fl. Gr. t. 784.

— *hirsuta.* 1½. June. South Europe. Syn.,

Geropogon calyculatus. Jacq. Vind.

t. 106.

— *hispanica.* 3. July. Spain. 1576.

— *humilis.* See *S. austriaca*.

— *intermedia.* June. Russia. Syn., *Podospermum*

intermedium.

— *Jacquina.* June. Persia. 1838. Syn.,

Podospermum canum.

— *lacinia'ta.* 2. June. South Europe. 1640.

Sibth. Fl. Gr. t. 788. *Podospermum*

laciniatum.

— *landa'ta.* 1. July. Iberia. 1824.

— *latifolia.* June. Persia. 1830.

— *mol'lis.* 1½. July. Caucasus. 1818. B. M.

t. 3027.

— *octangula'ris.* 1. June. South Europe.

1818. Syn., *Podospermum octangulare*.

— *pum'ila.* 1. June. Spain. 1816. Syn.,

Podospermum pumilum.

— *purpu'rea.* 2. Purple. May. Austria. 1759.

B. M. t. 2294.

— *resedace'folia.* 1½. June. South Europe. 1818.

Syn., *Podospermum resedacefolium*.

— *ro'sea.* 1½. Pink. July. Hungary. 1807.

— *taraxacifolia.* 1. June. Bohemia. 1820.

Jacq. Ic. t. 160. Syn., *Podospermum*

taraxacifolium.

— *tubero'sa.* ½. June. Volga. 1825.

— *undula'ta.* 1-2. Purple. July. Algeria.

1874. B. M. t. 6127.

Scorzone'ra in the kitchen-garden is the *S. hispanica*, grown for its parsnip-like roots. Sow annually, in any open light spot of ground, the latter end of March or beginning of April. Trench the ground, and with the bottom spit turn in a little dung; sow in half-inch deep drills, twelve inches asunder. Thin the plants to ten inches distance; they will grow freely, and their roots continue increasing in size till September. The roots may either remain in the ground, to be drawn as wanted, or taken wholly up in autumn when their leaves decay, and preserved in sand all winter.

To save Seed.—Let some of the plants remain where sown, when they will shoot up in the spring, and produce plenty of seed in autumn.

Scotch Asphodel. *Tafel'idia alpi'na.*

Scotch Bonnets. *Mara'smius ore'ades*, a fungus.

Scotch-kale. *Bra'ssica olera'cea sabellica.*

Scotch Laburnum. *Cytisus alpi'nus.*

Scotch Pine. *Pi'nus sylve'stris.*

Scotch Primrose. *Pri'mula sco'tica.*

Scot'tia. (Named after *Dr. Scott*, once professor of botany in Dublin. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*.) United with **Bossiaea** in the "Genera Plantarum."

Greenhouse evergreen shrubs, from Australia. Cuttings of shoots, when getting a little firm at the base; sandy, fibry loam one part, and two parts of sandy, fibry peat, with a little charcoal. Winter temp., 40° to 48°.

S. angustifolia. 6. Green, yellow. April.

1825. B. R. t. 1268. Sometimes regarded

as a variety of *S. dentata*.

— *denta'ta.* 3. Red, green. July. 1803.

— *la'vis.* 3. Yellow, scarlet. June. 1833.

B. R. t. 1662. Syn., *S. dentata*, var.

hastata.

— *trapezifo'rmis.* January. 1825.

Screen. All cooling is occasioned either by the heat being conducted from a body by a colder, which is in contact with it, or by radiating from the body cooled, though circumstances accelerate or retard the radiation; and whatever checks the radiation of heat from a body is a screen, and keeps it warmer. For screening or protecting the blossom of wall-fruit, Mr. Errington states:—We do not know that any material is more proper for covering than thin canvas, such as is manufactured in widths of three yards, which is enough for most walls, which is sold at about fivepence

per square yard, so that every lineal yard costs fifteenpence; but then this canvas will last well for seven years if properly preserved, and a due care be exercised. Thus it will be seen, that the annual expense of protecting a lineal yard of walling is not more than two-pence-halfpenny, exclusive of a few ordinary poles. We place a pole every six feet, running under the coping at top, and straddling away nearly two feet at bottom. At two feet above the ground level an auger hole is bored in the pole, and an oaken peg driven in, the end left projecting nine inches forward; and when the canvas is lowered in the day, it hangs in folds on this line of pegs: this keeps it from contact with the damp soil. Every pole has a ring dangling from a staple close to the top; and on the outer face a rope of sash-cording is attached to the edge of the canvas opposite each ring; this being passed through the ring from the under side, enables the operator to pull it up or let it down with ease. Thus, when the canvas is lowered, the wall is uncovered, and *vice versa*. Now, these rings and cords will add to the expense; and, since both are very durable, we may, perhaps, add another halfpenny per lineal yard to the amount, accounting the ropes to last nearly as long as the canvas. A still more complete plan is to hang the canvas like curtains, or after the manner of the covering to what are termed conservatory walls.

For wall-trees, now that glass is become so much cheaper, the best of all screens may be employed, viz., glazed frames, of a length extending from the coping of the wall to the surface of the soil, about two feet from the stems of the trees. See **Glass Case**.

Screw Pine. *Pa'ndanus*.

Screw-tree. *Heli'ctres*.

Scrophularia. (So called from being a reputed remedy for Scrophula. Nat. ord., *Scrophulariaceæ*; Tribe, *Che-loneæ*.)

Hardy perennial herbs. Seeds, or divisions of the plants. Ordinary garden-soil.

S. chrysantha. $\frac{1}{2}$ -1 $\frac{1}{2}$. Golden-yellow. March. Asia Minor. 1882. B. M. t. 6629.
— *sublyrata*. 3. Green, purple. August. Portugal. 1879.

Scrub Oak. *Que'rcus Catesbaei*.

Scrubby Oak. *Lophi'ra africana*.

Scurvy Grass (*Cochlea'ria officinalis*) flourishes most in a sandy, moist soil. Sow as soon as the seeds are ripe

in June or July, in drills, eight inches apart, and half an inch deep. Thin to eight inches asunder, and those removed may be transplanted to a bed at similar distances, giving water at the time, and frequently afterwards, until fully established. The leaves are fit to gather during the following spring.

To obtain Seed.—A few plants must be left ungathered from in the spring. They will run up to flower about May, and perfect their seed in the course of the two following months.

Scutella'ria. Skull-cap. (From *scutella*, a little saucer; form of calyx. Nat. ord., *Labiatæ*; Tribe, *Stachydeæ*.)

Seeds and divisions in spring, and the evergreen kinds easily by cuttings under a hand-light; some of the tender species are very handsome, such as *cordifolia*; but the red spider must be looked after.

TENDER SPECIES.

S. albo-ro'sea. Lilac. Upper Amazons. 1869.
— *aura'ta*. Yellow. Brazil. 1863.
— *cordifolia*. 1. Scarlet, orange. September. Mexico. 1844. Stove evergreen. B. M. t. 4290.

Scuticaria. (From *scutica*, a whip; leaves as round as a whipcord. Nat. ord., *Orchideæ*; Tribe, *Vandeeæ*—*Maxillariaceæ*.)

Stove orchid, grown on blocks. See ORCHIDS. *S. Dodsonii*, G. C. 1881, xv. p. 9, is a very doubtful plant.

- *Hadwera.* 1‡. Green, chocolate, white. June. Brazil. 1851. Syn., *Bifrenaria Hadwera.* B. M. t. 4629.
 — *Steelii.* Yellow-spotted. July. Guiana. 1834. Syn., *Macillaria Steelii.* B. M. t. 3573; B. R. t. 1986.

Scyphanthus. (From *scyphos*, a cap, and *anthos*, a flower. Nat. ord., *Loasaceæ*.) A synonym of **Grammatocarpus**.

Hardy, yellow-flowered, twining annuals, from Chili. Seeds in the open air in May, or in a slight hotbed in March, to be afterwards transplanted.

S. elegans, Swt. Fl. Gard. t. 238, and *S. grandiflorus* are synonyms of *Grammatocarpus volubilis*.

Scythe. This mowing implement is confined, in the garden, to cutting the coarser, long grass, for which the mowing machine is not adapted. It is necessary that the mowers should not score the grass, that is, should not leave the mark of each stroke of the scythe, which has a very unsightly appearance; to prevent this, have the scythe laid out rather wider, an inch or two beyond heel and toe, especially for short grass; and in mowing keep the point rather out, and do not draw that part too fast forward, gathering the grass neatly to the left in a range; and having mowed to the end of the swath, mow it lightly back again, to trim off all scores and other irregularities unavoidably left the first time. A great inconvenience attending the old scythe is the difficulty of fastening and adjusting the blade to the handle. This is entirely obviated by *Boyd's Self-adjusting Scythe*. It is always a problem to determine the angle the blade should make with the handle, as it varies with every mower. A good

guide is for a perpendicular line to be chalked against a wall, and for the mower to stand close and directly fronting to this line; then, without moving his feet, and with arm at full stretch above his head, to chalk a line to the left, from the perpendicular line, as far as he can reach. The line he thus chalks should correspond with the angle of the scythe's blade, supposing the perpendicular line to represent the handle.

Sea Bells. *Convolvulus Soldanelia.*

Sea-buckthorn. *Hippophaë rhamnoides.*

Seaforthia. (Named after Lord Seaforth, a botanical patron. Nat. ord., *Palmææ*; Tribe, *Areceæ*.) A synonym of **Ptychosperma**, but most of the plants grown in gardens under this name belong to the genus **Pinanga**.

- S. coronata* = *Pinanga coronata*.
 — *costata* = — *costata*.
 — *Dicksonii* = — *Dicksonii*.
 — *elegans* = *Archontophoenix Cunninghamiana*.
 — *Kuhlii* = *Pinanga Kuhlii*.
 — *latifolia* = — *latifolia*.
 — *malayana* = — *malayana*.
 — *sylostris* = — *javamica*.
 — *Veitchii* = — *Veitchii*.

Sea-heath. *Frankenia laevis.*

Sea-holly. *Eryngium maritimum.*

Sea-kale. *Crambe maritima.* See **Crambe**.

In addition to what is there stated of its culture, we have only to give draw-

ings of the pots usually employed for blanching it; but see **Rhubarb** for a frame, which also answers, when fermenting materials are heaped over, to force it.

The following is also a good mode of forcing:—On each side of a three-foot

bed dig a trench two feet deep, the side of it next the bed being perpendicular, but the outer side sloping, so as to make it eighteen inches wide at the bottom,

but two and a half at the top. These trenches fill with fermenting dung, which, of course, may be renewed if found necessary, and frames put over the plants, the light to be completely excluded by boards, matting, etc. The accompanying sketch represents a section of the construction.

Sea Lavender. *Statice Limonium*.

Sea Ragwort. *Cineraria maritima*.

Sea-side Grape. *Coccoloba*.

Sea-side Balsam. *Croton eleuteria*.

Sea-side Laurel. *Xylophylla latifolia*.

Sea-weed. See **Green Manure**.

Sebæa. (Named after *A. Seba*, a Dutch botanist. Nat. ord., *Gentianæ*; Tribe, *Exacææ*.)

Greenhouse annuals, all but *ovata* from South Africa. Seeds in a sweet hotbed in March, pricked out or potted, and either bloomed in the open garden, or in the greenhouse after May.

S. albens. $\frac{1}{2}$. White. August. 1820.

— auræa. $\frac{1}{2}$. Yellow. July. 1824.

— cordata. $\frac{1}{2}$. Yellow. July. 1815.

— ovata. $\frac{1}{2}$. Red. August. New S. Wales. 1820.

Secamone. (Altered from *squamona*, the Arabic name. Nat. ord., *Asclepiadacææ*.)

Stove, white-flowered, evergreen twiners. Cuttings of firm side-shoots when about three inches in length; fibry loam, two parts; fibry peat and very rotten dung, or leaf-mould, dried, one part; silver sand and charcoal, to keep it open. Winter temp., 50° to 60°; summer, 60° to 85°.

S. ægyptiaca. 6. July. Egypt. 1752.

— elliptica. 6. N. Holland. 1824.

— emetica. 6. India. 1816. Wight Ic. t. 1288.

Sechium. Choko. (From *sekiso*, to fatten; hogs are fed on the fruit in Jamaica. Nat. ord., *Cucurbitacææ*.)

A cucumber-like, yellow-flowered annual; seeds in a hotbed, and either cultivated in houses or pits; or, after June, in the open air; light, rich soil.

S. edule. 6. June. W. Ind. 1816.

— palmatum. June. Mexico. 1827.

Securidaea. (From *securis*, a hatchet; form of the wing-like process at the end of the pod. Nat. ord., *Polygalacææ*.)

Stove evergreen twiners, from the West Indies. Cuttings of half-ripened shoots, in sand, under a bell-glass, and in bottom-heat. Winter temp., 50° to 60°; summer, 60° to 80°. Sandy loam and sandy, fibry peat.

S. erecta. Purple. July. 1824.

— paniculata. Yellow. July. 1820.

— ramiflora. Yellow, red. August. Siberia. 1785. Syns., *Phyllanthus ramiflorus* and *Xylophylla ramiflora*.

S. virgata. 10. White. 1739.

— volubilis. 10. White. 1739.

Se'dum. Stonecrop. (From *sedere*, to sit; they grow as if sitting on stones, rocks, walls, etc. Nat. ord., *Crassulacææ*.)

Annuals, by seeds, on raised dry places, such as banks and rock-works; perennials, by divisions and cuttings, which root most readily, and all of which prefer dry, sandy, loamy soil; the more tender of these may be grown in well-drained pots, in sandy loam and brick-rubbish, and treated as alpine. The greenhouse kinds require similar treatment, only a higher temperature, and to be kept even drier in winter.

HARDY HERBACEOUS.

S. acre. 4. Yellow. June. Britain. Eng. Bot. ed. 3, t. 532. Varieties are:—*aurum*, *elegans*, and *majus*.

Seed-Room. All that has been said relative to the *Fruit-room* is applicable to this. Everything liable to cause decay or germination is to be avoided; and if one relative direction more than another requires to be urged upon the gardener, it is comprised in these words—*keep it as dry as possible*: the room may be even hot, so that it is not damp.

Seemannia. (Named after *Bert-hold Seemann*, a botanist and traveller. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerceæ*. Allied to *Achimenes* and *Isoloma*.)

Stove perennial herbs. For cultivation, see *GESNERA*.

- S. Benaryi*. See *S. silvatica*.
 — *silvatica*. 3-4. Bright scarlet. Winter. Peru. 1875. Syn., *S. Benaryi*, Gd. t. 814, and *S. ternifolia*, Gd. t. 126.
 — *ternifolia*. See *S. silvatica*.

Selagine'lla. (A diminutive of *Selago*. Nat. ord., *Lycopodiaceæ*.)

Stove and greenhouse evergreens, some resembling mosses. See *LYCOPodium*, from which some of the following species are taken.

Se'lago. (From the Celtic *sel*, sight, and *jach*, salutary; supposed effects on the eyes. Nat. ord., *Selaginaceæ*.)

Greenhouse evergreens, from South Africa. Cuttings of the points of shoots, or rather the short, stubby side-shoots, taken off close to the stem, in spring and autumn, in sand, under a bell-glass, but raised at night to prevent damping. Sandy loam and vegetable mould. The protection of a greenhouse; but many of them are worth a place in the flower-garden in summer.

- S. angustifolia*. August. 1819.

Sela'ndria a'tra. Pear Saw-Fly. The upper surface of Pear-tree leaves during the months of July, August, and September, are liable to be destroyed by what is very characteristically named the *slimy grub*. These grubs are nearly half an inch long, cylindrical, but thicker towards the head than at the other extremity. The whole body, except at the time of skin-casting, is covered with a sticky, greenish-black matter, and from this they have been named. Whilst feeding, the fore part of the body is so swollen that the vermin looks somewhat like a small tadpole. If the slimy matter is removed from the body, this is found to be a grub or caterpillar with twenty feet, and of a pitchy-brown colour. At the

last-but-one casting of its skin the sliminess no longer appears, and the grubs become of a clayey colour. They finally form a brown cocoon about October, and remain in the pupa state until the following June or July, when the perfect insect comes forth in the form depicted in the annexed cut, but of the size shown by the cross lines above it. It is known as the *Sela'ndria a'tra*. Linnæus calls it the Cherry Saw-Fly (*Tenthredo cerasi*), from the mistaken opinion that it attacked the leaves of that tree only, whereas its grubs are more frequently found on the leaves of the Pear. This fly is shining black, and the tips of the legs yellowish. The female lays her eggs on the upper surface of the leaves. The slime on the grub is of a peculiar nature, not being dried by exposure to the hottest sunshine.

Sele'nia. (Perhaps from *selene*, the

moon. Nat. ord., *Cruciferae*; Tribe, *Alyssineae*.)

Hardy annual, with showy, sweet-scented flowers.

S. aurea. ♀. Golden-yellow. June. Texas and Arkansas. 1881. B. M. t. 6607.

Selenipe'dium. (From *selenis*, a little crescent, and *pedion*, a slipper; the shape of the labellum. Nat. ord., *Orchideae*; Tribe, *Cypripediceae*.)

This genus only differs from *CYPRIPEDIUM* in having a three-celled ovary, whereas in *CYPRIPEDIUM* the ovary is one-celled. In all other respects the two genera are identical.

Self. A flower with petals of only one colour.

Self-heal. *Prunella vulgaris*.

Selliguea. (Probably from the Javanese name. Nat. ord., *Filices*.)

Stove, yellow-spored ferns. See *FERNS*.

S. caudifolmis. Malay Archipelago. 1862.

— *flavescens*. May. E. Ind.

— *Hamiltoni*. May. Nepal.

— *heterocarpa*. June. Java.

— *macrophylla*. May. Java.

— *potrifolia*. May. Nepal.

Semecarpus. Marking Nut-tree. (From *semeion*, a mark, and *karpos*, fruit; the black juice used for marking clothes. Nat. ord., *Anacardiaceae*; Tribe, *Anacardiaceae*. Allied to *Anacardium*.)

Stove, greenish-yellow-flowered, evergreen trees. Cuttings of ripe shoots in sand, under a glass, in heat, in March or April; peat, loam, leaf-mould, and sand. Winter temp., 50° to 60°; summer, 60° to 90°.

S. Anacardium. 20. India. 1820. Wight Ic. t. 559. Syns., *Anacardium longifolium* and *Cassivium longifolium*.

— *cuneifolium*. 20. India. 1824. Syn., *S. cuneifolium*.

Semeiandra. (From *semeia*, a banner, and *aner*, a male; referring to the petal-like appendage to each stamen. Nat. ord., *Onagraceae*.)

A greenhouse shrub, allied to *Fuchsia*, like which it may be cultivated.

S. grandiflora. 5. Scarlet. March, and throughout the summer. Mexico. 1853. B. M. t. 4727.

Sempervivum. Houseleek. (From *sempervivo*, to live for ever; tenacity of life. Nat. ord., *Crassulaceae*.)

Hardy and frame kinds, by division, and by cuttings, and most of them delight in dry, sandy soil, kept moist only when growing. Greenhouse kinds are also freely propagated by cuttings, dried for several days at the cut part; grown in sandy loam, leaf-mould, and brick-rubbish, and kept dry and in a state of rest in winter. Winter temp., 38° to 45°; summer, 55° to 75°.

Sena'cia glau'ca. A synonym of *Elæodendron pedunculatum*.

Seneci'llus. (A diminutive of *senecio*. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.) A synonym of **Senecio**.

S. purpurata is a synonym of *Cineraria purpurata*.

Senec'io. Groundsel. (From *senex*, an old man; naked receptacle compared to a bald head. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

So difficult are the species to determine, that they have often been classed under numerous other genera. All yellow-flowered, where not otherwise specified. Annuals, by seeds in the open border, and in a slight hotbed; perennials, by seed, and division of the plant, and also in common garden-soil, shrubby kinds by seeds, and easily by cuttings, and mostly requiring a little peat or dried leaf-mould along with the soil, and the protection of a cool greenhouse. The double varieties of *el'egans* are much used in flower-gardens; but the single varieties are also very beautiful. The double varieties are preserved by cuttings in winter, and must be saved from damp.

Sensitive Fern. *Oncle'a sensibilis*.

Sensitive Plant. *Mimosa pudica*. There are several other plants which give evidence of being sensitive. The Venus Fly-Trap (*Dionaea muscipula*) has jointed leaves, which are furnished on their edges with a row of strong prickles. Flies, attracted by honey which is secreted in glands on their surface, venture to alight upon them. No sooner do their legs touch these parts than the sides of the leaves spring up, and, locking their rows of prickles together, squeeze the insects to death. *Oxalis sensitiva* and *Smitthia sensitiva* are similarly irritable, as are the filaments of the stamens of the Berberry. One of this sensitive tribe, *Desmodium gyrans*, has a spontaneous motion; its leaves are frequently moving in various directions, without order or co-operation. When an insect inserts its proboscis between the converging anthers of a Dog's Bane (*Apocynum androsæmifolium*), they close with a power usually sufficient to detain the intruder until death occurs.

Septas. (From *septem*, seven; the number prevailing in the parts of the flower. Nat. ord., *Crassulaceæ*.) A synonym of **Crassula**.

Greenhouse, white-flowered evergreens, from South Africa. Increased by division of the roots; plants kept dry in winter; sandy loam and brick-rubbish. Winter temp., 38° to 45°.

S. cape'nsis. See *Crassula Septas*.
— *globiflora*. B. M. t. 1472. See *Crassula globiflora*.
— *umbellata*. A synonym of *Crassula umbellata*.

Sequoia. Native name. (Nat. ord., *Coniferæ*; Tribe, *Taxodiæ*. Syns., *Washingtonia* and *Wellingtonia*.)

Hardy evergreen. For cultivation, see **TAXODIUM**, to which it is allied.

S. gigantea. 300. California. 1853. Syn., *Wellingtonia gigantea*. B. M. tt. 4777-8.
— *au'rea*. Young twigs yellowish.
— *pendula*. Branches pendulous. 1871.
— *sempervirens*. 300. Upper California. Syn., *S. pyramidata*. Californian Evergreen Redwood.
— *albo-spica*. Tips of young shoots creamy-white.
— *glauca*. Leaves tinged with glaucous blue.
— *taxifolia*. Leaves broader than in the type and glaucous.
— *variegata*. Leaves glaucous and slightly variegated. 1890.

Seraphyta. (From *ser*, a silk-worm, and *phyton*, a plant; the flowers are said to resemble silkworms. Nat. ord., *Orchidææ*; Tribe, *Epidendraceæ-Læviææ*.)

Stove, epiphytal orchid, requiring the same culture as **EPIDENDRUM**.

S. diffusa. 2. Greenish-white. April. West Indies. 1816. Syn., *Epidendrum diffusum*. B. M. t. 3565.

Serapias. (An ancient Greek name for some *Orchis*. Nat. ord., *Orchidææ*; Tribe, *Ophrydææ-Serapieææ*.)

Hardy terrestrial orchids. For cultivation, see **ORCHIS**, to which it is allied.

S. cordigera. 2. Lilac, purple. Mediterranean region. B. M. t. 5868A.
— *lingua*. 2. Lilac, red. Mediterranean region. B. M. t. 5868B.
— *elongata*. 2. Brown-purple. April. Sicily. 1878.
— *tuteola*. Purplish, yellowish. May. Sicily. 1876.
— *longipetala*. 1½. Purple, greenish. May. Sicily. 1876.
— *pallidiflora*. 1. May. Sicily. 1876.
— *papilionacea-lingua*. 1. Green, purple. S. France. 1876. A natural hybrid between *Orchis papilionacea* and *S. lingua*. B. M. t. 6255.

Serenoa. (In honour of the late *Sereno Watson*, a distinguished North American botanist. Nat. ord., *Palmææ*; Tribe, *Corypheææ*.)

An elegant, dwarf, greenhouse palm.

S. serrulata. 4-8. Greenish. June. Southern United States. 1840. Syn., *Sabal serrulata*.

Sericocarpus. White-topped Aster. (From *serikos*, silken, and *karpus*, fruit; the fruit is crowned by silky hairs. Nat. ord., *Compositææ*; Tribe, *Asteroidææ*.)

Hardy, perennial herbs, requiring the same culture as **ASTER**.

S. comysoides. 2. White. Summer. North America. 1778.
— *solidagineus*. 2. White. Autumn. North America. 1699. Syn., *Aster solidagineus*.

Sericographis. (From *serikos*, silk, and *grapho*, to write. Nat. ord., *Acanthaceææ*; Tribe, *Justicieææ*. Allied to *Aphelandra*.) A synonym of **Jacobinia**.

Stove half-herbaceous perennial. Easily increased by cuttings. For culture, see **JUSTICIA**.

S. Ghiesbreghtiana. Gf. t. 98. See *Jacobinia Ghiesbreghtiana*.
— *Mohrntlii*. Scarlet. Mexico. 1881. A climber.

Seringia. (Named after *M. Seringa*, a Swiss botanist. Nat. ord., *Sterculiaceææ*; Tribe, *Lasiopetaleææ*. Allied to *Lasiopetalum*.)

Greenhouse evergreen. Cuttings of young shoots in sand, under a bell-glass, in April or May; sandy peat one part, sandy, fibry loam two parts. Winter temp., 40° to 48°.

S. ovata. A synonym of *Ptelidium ovatum*. (Nat. ord., *Celastrineææ*.)
— *platyphyllo*. 12. White. June. Australia. 1822.

Seriola. (From *seris*, succory; as the species resemble this plant. Nat. ord., *Compositææ*; Tribe, *Cichoriaceææ*.) This genus is now united to **Hypochæris** under the specific names annexed.

All hardy herbaceous plants, except *rube'scens*, which is annual, and all natives of Sicily. Seed sown in early spring, in any common garden-soil.

S. ætne'nsis, Sibth. Fl. Gr. t. 815, and *S. d'albicans* are synonyms of *Hypochoeris ætne'nsis*.
1. Yellow. July. Sicily. 1763.

— *glau'ca* and *S. rube'scens* are synonyms of *Hypochoeris lævigata*. 1. Yellow. May. Sicily. 1828.

— *u'rens* is a synonym of *Hypochoeris cretensis*.
‡. Yellow. July. South Europe. 1773.

Seri'ssa. (Name of a plant mentioned by Dioscorides. Nat. ord., *Rubiaceæ*; Tribe, *Anthospermeæ*.)

Greenhouse, white-flowered evergreens, from Japan. Cuttings in spring, under a glass; loam, peat, and sand. Probably hardy in the south of England.

S. fœ'tida. 2. May. 1787. Syns., *Lycium fœtidum* and *L. japonicum*, B. M. t. 361.
— *mu'tiptex*. May.

Serra'tula. Saw-wort. (From *serra*, a saw; edges of the leaves. Nat. ord., *Compositæ*; Tribe, *Cynaroideæ*.)

Perennials, by seeds and divisions in spring; annuals, by seed; common garden-soil. All purple-flowered, except where otherwise stated.

S. ala'ta. 2. Purple. July.

— *alpi'na*. See *Saussurea alpina*.

— *ama'ra*. See *Saussurea amara*.

— *angustifo'lia*. See *Saussurea angustifolia*.

— *argu'ta*. See *S. tinctoria*.

— *ca'spica*. See *Karelinia caspica*.

— *centauroi'des*. 1. Purple. July. Siberia. 1804.

— *corona'ta*. 5. Purple. July. Siberia. 1739.

— *cyano'i'des*. A synonym of *Jurinea Pollichii*.

— *cyano'ro'i'des*. 3. July. Pyrenees. 1640.

Syn., *Rhaponticum cynaroides*.

— *depre'ssa*. 1. Purple. July. Caucasus.

1818. Linn. Trans. xi. t. 38.

— *di'scolor*. See *Saussurea discolor*.

— *e'legans*. Linn. Trans. xi. t. 37. See *Liatris elegans*.

— *flav'e'scens*. White. July. Spain. 1825.

Syn., *S. leucantha*. Annual.

— *heterophy'lia*. 2. Purple. July. Dauphiny.

1824. Syn., *S. Kitaibelii*.

— *Kitaibe'lii*. See *S. heterophylla*.

— *leuca'ntha*. See *S. flavescens*.

— *liatro'i'des*. See *Saussurea pycnocephala*.

— *linearifo'lia*. A synonym of *Jurinea linearifolia*.

— *multifo'ra*. 2. July. Siberia. 1816. A synonym of *Jurinea linearifolia*.

— *ni'tens*. See *Centaurea nitens*.

— *ni'tida*. 2. Purple. July. Siberia. 1837.

— *panno'nica*. See *Cnicus pannonicus*.

— *pilo'sa*. See *Liatris pilosa*.

— *pulche'ra*. B. M. t. 2589. See *Saussurea pulchella*.

— *pygma'ea*. See *Saussurea pygmaea*.

— *quinquefo'lia*. 3. Deep purple. July. Caucasus. 1804. B. M. t. 1871.

— *radia'ta*. 2‡. Purple. July. Hungary.

1800. Biennial.

— *sa'lsa*. See *Saussurea crassifolia*.

— *si'mplex*. B. M. t. 2482. A synonym of *Jurinea mollis*.

— *spica'ta*. Andr. Rep. t. 401. See *Liatris spicata*.

— *transylva'nica*. A synonym of *Jurinea mollis*.

Serru'ria. (Named after J. Serrurier, a German botanist. Nat. ord., *Proteaceæ*; Tribe, *Protea*. Alliance near *Leucospermum*.)

Greenhouse, South African evergreens; purple-flowered, except where otherwise specified. Cuttings of ripe shoots in sand, under a bell-glass, and kept cool, the glass being raised and frequently removed at night, to prevent damping, the cuttings at the time protected by a frame or pit; light, fibry loam, with a portion of charcoal and broken bricks or freestone. Winter temp., 38° to 48°, with a shaded position for the pots in the heat of summer; the heads will stand the sun freely if the roots are protected.

S. abrotanifo'lia. 4. Pink. 1803. Syn., *Protea abrotanifolia*. Andr. Rep. t. 522. This name has been used for other species, which will be found in this list.

— *acroca'rpa*. Lilac. April. 1822.

— *adse'ndens*. 2. 1819.

— *œ'mula*. 3. 1803.

— *arena'ria*. 1. 1803.

— *Burma'nsis*. 2‡. 1786.

— *clia'ta*. 2. 1803.

— *conge'sta*. 2. Pink, white. July. 1800. Syn., *Protea triternata*. Andr. Rep. t. 337.

— *cyano'i'des*. 1‡. 1803.

— *decu'mbens*. 1. 1818.

— *diffu'sa*. 3. 1810.

— *eleva'ta*. Lilac. April. 1821.

— *elonga'ta*. 1‡. 1800.

— *emargina'ta*. 2. Pink. 1800. Syn., *Protea abrotanifolia*, var. *minor*. Andr. Rep. t. 536.

— *flagella'ris*. 2. 1816.

— *flo'rida*. 2. 1824.

— *glabe'rriima*. 1. 1825.

— *glomerata*. 3. 1789.

— *Nive'i'ni*. 1‡. 1800. Syn., *Protea decumbens*. Andr. Rep. t. 349.

— *odora'ta*. 2. Pink. 1803. Syn., *Protea abrotanifolia*, var. *odorata*. Andr. Rep. t. 545.

— *peduncula'ta*. 7. July. 1789. Syn., *Protea glomerata*. Andr. Rep. t. 264.

— *phytico'i'des*. 3. 1789. Syn., *Protea abrotanifolia*. Andr. Rep. t. 507.

— *pinna'ta*. 1. Pink. 1803. Syn., *Protea pinnata*. Andr. Rep. t. 512.

— *Rozbu'rgii*. 3. White. 1806.

— *rubricau'lis*. 2. 1818.

— *scario'sa*. Lilac. 1816.

— *squarro'sa*. 2. 1810.

— *triterna'ta*. 7. July. 1802. Syn., *Protea argentiflora*. Andr. Rep. t. 447.

— *villo'sa*. 2. July. 1829.

Service Berry. *Amela'nchier vulgari's*.

Service. (*Py'rus dome'stica*.) There are three varieties: Apple-shaped, Pear-shaped, and Berry-shaped.

Propagation.—By *Grafting* on the apple, medlar, and hawthorn.

By *Cuttings* and by *Seed*, as directed for the *Apple*.

Soil.—Clayey loam, well drained, suits it best.

Culture.—They are best trained as dwarf standards or espaliers. See **Medlar**.

Gather the fruit in autumn, and treat it like that of the Medlar.

Sesba'nia. (From *sesban*, the Arabic name of *S. ægyptia'ca*. Nat. ord., *Leguminosæ*; Tribe, *Galegææ*. Alliance near *Clianthus*.)

Yellow-flowered, except *S. coccinea*. Annuals

require to be sown in a hotbed, in April, and flowered either in the plant-stove or a warm greenhouse; shrubs, by cuttings of the half-ripened, stubby shoots in sand, under a bell-glass, in bottom-heat; fibry loam and sandy peat. Winter temp., 60°; summer, 60° to 90°, with abundance of moisture.

STOVE EVERGREENS.

- S. ægyptiaca*. 4. July. Egypt. 1680. Wight, Ic. t. 32.
 — *coccinea*. 25. Red. August. East Indies. 1768. Syn., *Agati coccinea*.
 — *longifolia*. 3. July. New Spain. 1820. Syn., *Daubentonia longifolia*.
 — *occidentalis*. 4. July. W. Ind. 1816.

STOVE ANNUALS.

- S. aculeata*. 4. July. E. Ind. 1690.
 — *affinis*. 3. July. E. Ind. 1800.
 — *gracilis*. 3. July. 1820.
 — *pectata*. 6. July. W. Ind. 1823. Biennial. B. R. t. 873.
 — *punctata*. 3. July. Guinea. 1825.
 — *sericea*. 3. July. E. Ind. 1818.

GREENHOUSE ANNUAL.

- S. disperma*. 2. July. Florida. 1816. Syn., *Glottidium floridanum*.

Se'seli. Meadow Saxifrage. (A name used by Hippocrates. Nat. ord., *Umbelliferae*.)

Hardy herbaceous plants. Ordinary garden-soil. Propagated by seeds.

- S. dichotomum*. 2. White. July. Tauria. 1818. Perennial. B. M. t. 2073.
 — *gummi ferum*. 4. White. Summer. Tauria. 1804. Biennial. B. M. t. 2259.

Sesle'ria. (In honour of *Leonard Sesler*, an Italian botanist. Nat. ord., *Gramineæ*; Tribe, *Phalarideæ*.)

Hardy, perennial grass.

- S. cœrulea*. $\frac{1}{2}$ -1 $\frac{1}{2}$. Blue-grey. May. Britain.

Sesu'vium. (Derivation doubtful. Nat. ord., *Ficoideæ*.)

Greenhouse, succulent herbs or sub-shrubs. Sandy soil, well drained. Cuttings inserted in sand, under a bell-glass.

- S. Portulacastrum*. Green, reddish. June. 1692. Syn., *Aizoon canariense*. Andr. Rep. t. 201. Sea Purslane; West Indian Samphire.
 — — *sessile*. Flowers sessile.
 — *revolutifolium*. Red, white. July. Cuba. Syn., *S. Portulacastrum*, var. *revolutum*. B. M. t. 1701.

Seta'ria. (From *seta*, a bristle; referring to the bristles on the spikelets. Nat. ord., *Gramineæ*; Tribe, *Panicææ*.)

Hardy, annual grasses, of no horticultural value.

- S. italica*. A garden form of this has been called *Panicum italicum*, var., *japonicum*. Gf., 1887, p. 278, fig. 72.
 — *verticillata* has become naturalized in the south-east of England.
 — *viridis*. 1. Green. July. Britain.

Sets are the tubers, or portions of tubers, employed for propagating potatoes and other tuberous-rooted plants. It may be accepted as a rule universally applicable to them, that a moderately-sized whole tuber is always to be preferred to a cutting of a tuber.

Setterwort. *Helleborus foetidus*.

Setting is fertilizing the female blossoms with pollen from the male blossoms. A plant is said to be a *shy setter* when this fertilizing is apt to fail.

Set Wall. *Valeria'na*.

Severi'nia. (After *M. A. Severino*, Lecturer on Anatomy at Naples in the sixteenth century. Nat. ord., *Rutaceæ*; Tribe, *Aurantiaceæ*.)

Greenhouse evergreen shrub. For culture, see CITRUS.

- S. buxifolia*. 3. White. May. China. Syn., *Citrus buxifolia*.

Seville Orange. *Citrus vulgaria*.

Sewerzo'wia. (After a Russian traveller, who discovered this plant. Nat. ord., *Leguminosæ*. Allied to *Astragalus*.)

- Hardy annual. Ordinary garden-soil. Seeds. *S. turkestanica*. $\frac{1}{2}$. Summer. Turkestan. 1883. Gf., 1883, p. 250.

Seyme'ria. (Named after *H. Seymour*, an English naturalist. Nat. ord., *Scrophulariaceæ*; Tribe, *Gerardiæ*.)

Hardy, yellow-flowered annuals, from North America. Seeds in April, in a peat border.

- S. pectinata*. 1. July. 1820.
 — *tenuifolia*. 1. July. 1730. Syn., *Gerardia Afzelii*.

Seymou'ria. (In compliment to the *Hon. Mrs. Seymour*, of Woburn. Nat. ord., *Geraniaceæ*; Tribe, *Geraniææ*.) A synonym of **Pelargonium**.
S. asarifolia. Swt. Geran. t. 206. See *Pelargonium asarifolium*.

Shaddock. *Citrus decumana*.

Shades are for prolonging the time of a plant's blooming, or promoting the rooting of cuttings, by excluding the sunlight. See **Cuttings**, **Screens**, and **Tulip**.

Shallot. See **Eschallot**. *Allium ascalonicum*.

Shanking is the technical term for a gangrene which attacks the footstalks of grapes and the stems of cabbages which have vegetated through the winter. The shanking of the grape appears to be occasioned by the soil becoming exhausted, or by its temperature being too much below that in which the branches are vegetating; and, consequently, the supply of sap to the grapes being too much diminished, the parts which thus fail of support immediately begin to decay: this is an effect always the consequence of a diminished supply of sap, apparent either in the leaves, flower, or fruit. Shanking rarely appears in the grape if the roots of the

vine are within the house. Shanking in the cabbage arises from a very different cause, viz., the freezing of the stalk of the cabbage just where it comes in contact with the soil. The best preventive is dressing the soil with salt, about five bushels per acre, late in the autumn, and sprinkling charred vegetable matters among them. See **Damping-off**.

Sharewort. *Aster Tripo'lium*.

Sharp Cedar. *Aca'cia oxyc'e drus* and *Juni'perus oxyc'e drus*.

Shears are made of various forms, according to the use to which they are to be put. Straight ones are of service in clipping or pruning branches, which are too thick to be cut with a pruning knife. Some are made with long handles, to which the blades are attached nearly at right angles, to enable a man to cut the edge of a lawn without stooping; these are occasionally made with a wheel to run along the ground.

Sheep Laurel. *Ka'lmia angustifolia*.

Sheep's Scabious. *Jasio'ne*.

Shells. See **Animal Matters**.

Shelter. See **Screen**.

She - Oak. *Casuarina quadrivalvis*.

Shepherd's Beard. *Arno'pogon*.

Shepherd's Club. *Verba'scum thap'sus*.

Shepherd's Knot. *Potentilla Tormentilla*.

Shepherd's Purse. *Capse'lla bursa-pastoris*.

Shepherdia. (Named after the late W. Shepherd, curator of the Botanic Garden, Liverpool. Nat. ord., *Elæagnaceæ*. Allied to Hippophaë.)

Hardy deciduous shrubs, from North America. Generally by suckers; frequently by seeds; deep, sandy loam. Good shrubs for lawns or shrubberies.

S. argentea. 10. April. 1820. Syn., *Hippophaë argentea*.

— *canadensis*. 10. April. 1759. Syn., *Hippophaë canadensis*.

Shield Fern. *Aspi'dium*.

Shifting. See **Potting** and **One-shift System**.

Shortia. (After Dr. Short, author of the "Medicina Britannica," published in London, 1747. Nat. ord., *Diapensiaceæ*.)

Hardy perennial.

S. californica of Rev. Hort. 1883, p. 41, fig. 7, appears to be some Composite.

S. galacifolia. White. February to April Alleghany Mountains. 1888. Gard. and For. 1888, i., p. 509, fig. 80. Syn., *Schizodon uniflorus*.

Shreds for fastening trees to walls, etc., are best made of the list or selvage torn from black or blue cloth, and may be obtained of any tailor. The smallest possible number of shreds, and the narrowest consistent with strength, should be employed; for wherever the shred envelopes the branch, the wood beneath is never so well ripened as those parts exposed to the light and air, which are so essential to enable the bark to assimilate and separate from the sap those secretions which are required for the next year's growth. Shreds should always be long enough to permit the ends to be doubled over, so that the nail may pass through four thicknesses of the cloth, otherwise they look ragged, and are liable to tear away from the nail. If old shreds are re-used, they should be previously boiled for a few minutes to destroy any insect-eggs, or larvæ, they may contain.

Shrivelling of the berries of the grape in stoves arises from the roots of the vine not supplying a sufficiency of sap. This occurs if the roots are in a cold, heavy soil, or are vegetating in an outside border, the temperature of which is too low compared with that of the stove. In the first case, thorough draining and the incorporation of calcareous rubbish; and in the second case, protection to the border and stem, will remove the evil.

Shrubbery is a garden, or portion of a garden, devoted to the cultivation of shrubs.

Shrubs are trees of a dwarf growth, not exceeding in height twelve or fifteen feet, unless they are climbers, and having, if permitted, branches and foliage clothing the entire length of their stems.

Shrubby Pink. *Dia'nthus fruticosus*.

Shute'ria. (Named after Dr. Shuter, of Madras. Nat. ord., *Convolvulaceæ*.) See **Hewittia**.

S. bicolor. B. R. t. 318. A synonym of *Hewittia bicolor*.

Shutting-up is closing the lights of frames, pits, greenhouses, and stoves, which have been opened for the admission of air.

Siba'ldia. (Named after Dr. Sibbald, of Edinburgh. Nat. ord., *Rosaceæ*; Tribe, *Potentilleæ*.) A synonym of **Potentilla**.

Seeds, but chiefly by division of the plant in spring; fibry, sandy loam, and fibry peat. They are best kept as little alpiners, in pots, protected from frost and wet in winter, and shaded from the midday sun in summer.

S. erecta. See *Chamaerhodos erecta*.
— *grandiflora*. See *Chamaerhodos grandiflora*.
— *otopetalata*, *parviflora*, and *procumbens* are synonyms of *Potentilla Sibbaldia*.

Siberian Crab. *Pyrus prunifolia*.

Siberian Pea-tree. *Caragana*.

Sibthorpia. (Named after Dr. Sibthorp, of Oxford. Nat. ord., *Scrophulariaceae*; Tribe, *Digitaleae*.)

Yellow-flowered trailers. Seeds and divisions of the plant in spring; moist, sandy, shady peat-border. *Prostrata* requires the protection of a greenhouse in winter.

S. europaea. $\frac{1}{2}$. July. England.
— *variegata*. Leaves variegated.
— *peregrina*. $\frac{1}{2}$. Yellow. June. Madeira.
1771. Syns., *S. prostrata* and *Disandra prostrata*. B. M. t. 218. Sometimes regarded as a variety of *S. europaea*.

Sicana. (The Peruvian name of one species. Nat. ord., *Cucurbitaceae*.)

Vigorous growing stove climbers.

S. odorifera. Yellow. Brazil. 1889. Fruit like a large cucumber.
— *sphaerica*. Yellowish. Jamaica. 1890. B. M. t. 7109. Fruit globular, about the size of an orange.

Si'cyos. (A name used by Theophrastus for the Cucumber. Nat. ord., *Cucurbitaceae*.)

Greenhouse, or half-hardy annual.

S. edulis. A synonym of *Sechium edule*.

Sida. Indian Mallow. (A name used by Theophrastus for the Water Lily. Nat. ord., *Malvaceae*.)

This genus being widely dispersed through the world, contains stove, greenhouse, and hardy herbs or shrubs. They require a rich soil. Seeds; cuttings.

S. aurora. Yellow. India. B. C. t. 1842.
— *aurita*. Reddish. December. Java. 1821. B. M. t. 2495. Stove.
— *Bedfordiana*. B. M. t. 3892. See *Abutilon Bedfordianum*.
— *cristata*. B. M. t. 330. See *Anoda Dilleniana*.
— *globiflora*. 5. White. November. Mauritius. 1827. B. M. t. 2821.
— *graveolens*. B. M. t. 4134. See *Abutilon graveolens*.
— *hastata*. B. M. t. 1541. See *Anoda hastata*.
— *inequalis*. 7. White. May. Brazil. 1829. Stove shrub. B. M. t. 3436.
— *integerrima*. 16. Yellow, red. New Grenada. B. M. t. 4360. Stove.
— *malvaeflora*. B. R. t. 1036. See *Sidalcea campestris*.
— *molle*. B. M. t. 2759. A synonym of *Abutilon molle*.
— *na'paea*. 4-10. White. Summer. North America. Hardy perennial. B. M. t. 2193.
— *paoniaeflora*. B. M. t. 4170. See *Abutilon paoniiflorum*.
— *patens*. Yellow. Abyssinia. Andr. Rep. t. 571.
— *periptera*. B. M. t. 1644. A synonym of *Anoda punicea*

S. picta. B. M. t. 3840. A synonym of *Abutilon pictum*.

— *pulchella*. B. M. t. 2753. See *Plagianthus pulchellus*.

— *rosea*. See *S. speciosa*.

— *sessiliflora*. 3. Yellow. Autumn. South America. 1827. Stove sub-shrub. B. M. t. 2357.

— *speciosa*. Purplish-red. October. South America. 1820. Syn., *S. rosea*. B. M. t. 3150.

— *venosa*. B. M. t. 4463. See *Abutilon venosum*.

— *vitifolia*. B. M. t. 4227. A synonym of *Abutilon vitifolium*.

Sida'icea. (From *sida*, an ancient Greek name of a plant, and *alcea*, an ancient name of some *Malva*. Nat. ord., *Malvaceae*; Tribe, *Malveae*. Allied to *Callirhoe*.)

Hardy, mostly perennial herbs. For cultivation, see MALVA.

S. campestris. 3. Very pale pink. October. New Albion, Columbia. 1827. Syn., *Sida malvaeflora* of B. R. t. 1036.

— *ca'ndida*. 3. White. Rocky Mountains. 1882. Rev. Hort. 1891, p. 356, fig. 85.

Sideran'thus. (From *sideres*, starry, and *anthos*, flower. Nat. ord., *Compositae*; Tribe, *Asteroideae*.) A synonym of **Haplopappus**.

S. spinulosus. A synonym of *Haplopappus spinulosus*.

— *villo'sa*. A synonym of *Chrysopsis villosa*.

Sideri'tis. Ironwort. (From *sideros*, iron; supposed power of healing wounds by iron. Nat. ord., *Labiatae*; Tribe, *Stachydeae*. Allied to *Marubium*.)

Yellow-flowered, except where otherwise specified. Seeds; cuttings under a hand-light in summer; division of the plant in spring; dry, sandy, or chalky soil; well fitted for knolls and banks.

HARDY HERBACEOUS.

S. roma'na. 1. July. Italy. 1740. Annual.

— *serra'ta*. 1. August. Spain. 1818.

— *spino'sa*. 1 $\frac{1}{2}$. August. Spain.

HARDY EVERGREENS.

S. scordio'des. 1. September. France. 1597.

— *alpi'na*. 1. July. Pyrenees. 1827. Kn. and West. t. 31.

— *angustifo'lia*. 1. July. Pyrenees. 1597.

— *elonga'ta*. August. Spain. 1822. Half-hardy.

— *tau'rica*. 1 $\frac{1}{2}$. July. Tauria. 1822.

HALF-HARDY EVERGREENS.

S. angustifo'lia. 1. July. Spain. 1820.

— *chamaedri'fo'lia*. 1. July. Spain. 1816.

— *itico'fo'lia*. 1 $\frac{1}{2}$. July. Levant.

— *inea'na*. 1 $\frac{1}{2}$. July. Spain. 1752.

— *leuca'ntha*. 1. White. July. Spain. 1823.

— *perfolia'ta*. 2. September. Levant. 1731.

— *syri'aca*. 1 $\frac{1}{2}$. July. Levant. 1597.

GREENHOUSE SHRUBS.

S. canarie'nsis. Yellow. Canary Isles. 1869.

Ref. Bot. t. 160.

— *ca'ndicans*. 3. Yellowish. Teneriffe. 1714.

EXCLUDED SPECIES.

S. decu'mbens. See *Stachys Lamarckii*.

— *hyssopifo'lia*. See *Stachys recta*.

— *linearifo'lia*. See *Stachys stenophylla*.

Siderode'ndron. Iron-tree. (From *sideros*, iron, and *dendron*, a tree; in hardness of wood. Nat. ord., *Rubia-*

ceæ; Tribe, *Ixoreæ*.) A synonym of **Ixora**.

Stove evergreen tree. Cuttings of ripe shoots in sand, under a bell-glass, and in a moist heat; sandy, fibry loam, fibry peat, and leaf-mould. Winter temp. 50° to 60°; summer, 60° to 80°.

S. triflorum. 20. Pink. W. Indies. 1793. Now known as *IXORA FERREA*.

Sideroxylon. (From *sideros*, iron, and *xylon*, wood; the wood of certain species is very hard. Nat. ord., *Sapotaceæ*.)

S. melanophloeos. Jacq. H. Vind. t. 71. See *Myrsine melanophloeos*.

— *mitis*. B. M. t. 1858. White. June. South Africa. 1816. Greenhouse evergreen. This is probably a species of *ILEX*.

— *spinulosum*. See *Argania Sideroxylon*.

Side-saddle Flower. *Sarracenia*.

Siebera. (In honour of F. W. Sieber, a botanical traveller, 1785-1844. Nat. ord., *Umbelliferae*; Tribe, *Hydrocotyleæ*.)

Greenhouse, perennial herb. For culture, see *TRACHYMENE*.

S. Billardieri lanceolata. 3. White. Australia. 1829. Syn., *Trachymene lanceolata*. B. M. t. 3534.

Siegesbeckia. (Named after J. G. Siegesbeck, a German botanist. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*. Alliance near *Eclipta*.)

Hardy, yellow-flowered annuals. Seeds in a hotbed, in April; seedlings pricked off, and finally turned out into the flower-garden in the beginning of June; rich, light, sandy soil. *S. cordifolia*, *S. ibérica*, and *S. triangulāris* are sometimes regarded as varieties of *S. orientālis*. *S. cordifolia*. 20. August. Mexico. 1826.

— *droseroides*. See *S. orientālis*.

— *ibérica*. White. August. Iberia. 1818.

— *orientālis*. 2. September. India. 1730. Syn., *S. droseroides*. B. R. t. 1061; Swt. Fl. Gard. t. 203.

— *triangulāris*. 2. August. Mexico. 1825.

Sieve'sia. (Named after M. Sievers, a Russian botanist. Nat. ord., *Rosaceæ*; Tribe, *Potentillææ*.) Now united to **Geum**, under the specific names annexed.

Hardy, yellow-flowered, herbaceous perennials. Seeds, and division of the plant in spring; light, sandy soil.

S. anemonoides. ½. July. Kamtschatka. 1820.

GEUM ANEMONOIDES.

— *atlantica*. See *Geum allanticum*.

— *glacialis*. ½. July. Siberia. 1819. GEUM

GLACIALE.

— *montana*. ½. July. Austria. 1597. GEUM

MONTANUM.

— *paradoxa*. See *Falugia paradoxa*.

— *peckei*. B. M. t. 2863. See *Geum Peckei*.

— *reptans*. ½. July. Switzerland. 1597.

GEUM REPTANS.

— *rosea* and *triflora*. ½. July. Louisiana. 1826.

GEUM TRIFLORUM.

Sieves are made with various meshes,

according to the use for which they are

intended, such as cleaning seeds, sifting

soils, gravel, etc.

Sigmatostalex. (From *sigma*, S-shaped, and *stalex*, a stake. Nat. ord., *Orchideæ*; Tribe, *Vandææ-Oncidiææ*.)

Stove orchids. For culture, see *ONCIDIUM*.

S. malleifera. Yellow, with brown spots. New Grenada. 1883.

— *radicans*. Yellow, greenish, violet-purple. Brazil.

Silene. Catchfly. (From *sialon*, saliva; from the gummy secretion on the leaves of some, which entraps small flies. Nat. ord., *Caryophyllaceæ*; Tribe, *Sileneæ*.)

All propagated freely by seeds. Annuals, in the open garden, in April, and many, if sown in September, will bloom very early; the low-growing ones are very suitable for knolls and rock-works. Herbaceous ones also by division, and by cuttings of the young shoots in sand, under a hand-light, in summer; shrubby ones by similar means; rich, sandy loam.

GREENHOUSE BIENNIALS.

S. crassifolia. 1. Brown. July. Cape of Good Hope. 1774.

— *gigantea*. 3. White. June. N. Africa. 1738. Sibth. Fl. Gr. t. 432.

Sileno'psis. See **Lychnis**.

Silk-cotton Tree. *Bo*'mbax and *Eriode*'ndron.

Silken Sissy. *Ascle*'pias.

Silk Tree. *Albi*'zzia *Julibr*'assin.

Silk Vine. *Periplo*'ca *gra*'ca.

Silk-wood Tree. *Muntingia calabura*.

Silky Oak. *Grevillea robusta*.

Silphium. Rosin-plant. (From *Silphion*, a name used by Hippocrates for a plant producing gum-resin. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Hardy, perennial herbs, with a resinous juice. Ordinary garden-soil. Divisions.

S. albidiflorum. 4. Creamy-white. September. Texas. 1887. B. M. t. 6918.

— *laciniatum*. 3-6. Yellow. July. United States. B. M. t. 6534. The leaves of this species are said to face north and south, hence the names Compass Plant, Pilot Weed and Polar Plant.

— *perfoliatum*. 3. Yellow. July. North America. B. M. t. 3354.

— *terebinthinaeum*. 4-10. Yellow. Summer and autumn. North America. B. M. t. 3525.

— *trifoliatum*. 4-6. Yellow. August. North America. B. M. t. 3355.

Silver Bell Tree. *Hale'sia*.

Silver Berry. The fruit of *Elæagnus argentea*.

Silver Bracts. *Cotyledon Pachyphytum*.

Silver Bush. *Anthyllis Barbatervis*.

Silver Cedar. *Juniiperus virginiana*, var. *glauca*.

Silver Fir. *Abies pectinata*.

Silver Rod. *Asphodelus ramosus*.

Silver Tree. *Leucadendron argenteum* and *Elæagnus*.

Silver Weed. *Argyrea* and *Potentilla anserina*.

Silybum. (A name used by Dioscorides. Nat. ord., *Compositæ*; Tribe, *Cynaroideæ*.)

Hardy, perennial herb, found as a garden escape in some parts of Britain. Ordinary garden-soil. Seeds.

S. Marianum. 1-4. Rose-purple. Autumn. South Europe. Eng. Bot. ed. 3, t. 681. Blessed, Holy, or Our Lady's Milk Thistle.

Sima'ba. (Native name. Nat. ord., *Simarubaceæ*; Tribe, *Simarubæ*.)

Stove deciduous tree. Seeds from abroad, and cuttings. The seed is a valuable febrifuge. See QUASSIA.

S. Cedron. 20. May. New Grenada. 1846.

Simaru'ba. (The Guiana name. Nat. ord., *Simarubaceæ*; Tribe, *Simarubæ*. Allied to Quassia.)

Stove, yellowish-white-flowered evergreens, from the West Indies. Cuttings of the ripe shoots in sand, under a bell-glass, and in a strong, moist heat; fibry peat, and light, fibry loam. Winter temp., 55° to 65°; summer, 65° to 85°.

S. amara. 10. 1789. Bent. and Tr. t. 56. Syn., *S. officinalis*. Bitter or Mountain Damson; Stavewood.

S. glauca. 1824.

— *officinalis*. See *S. amara*.

— *Turæ*. Carmine. Porto Rico 1889 Gf. t. 1298.

Sime'this. (After the nymph *Sime'this*. Nat. ord., *Liliaceæ*; Tribe, *Asphodeleæ*.)

Hardy perennial. Compost of heath soil and sand. Division.

S. bicolor. 1. White, purplish. June. Northwest Africa; naturalized in a few localities in Britain. Eng. Bot. ed. 3, t. 1541.

Syn., *S. planifolia*.

— *planifolia*. See *S. bicolor*.

Simmondsia. (In memory of T. W. Simmonds, botanist and explorer. Nat. ord., *Euphorbiaceæ*; Tribe, *Buzaceæ*.)

Hardy evergreen shrub. Cuttings. Rich light loam with a little peat.

S. californica. 4. Green. California. Syn., *Buzus chinensis*.

Sinapis. Mustard. (From the Celtic *nap*, applied to the cabbage tribe. Nat. ord., *Crucifereæ*; Tribe, *Brassicæ*.) Now united with **Brassica**.

Hardy, yellow-flowered annuals. See MUSTARD.

S. alba. A synonym of *Brassica alba*.

— *ni gra*. A synonym of *Brassica nigra*.

Singa'na. (From *singa-singa*, the name in Guiana. A genus of doubtful affinity, which should perhaps be placed in the natural order *Leguminosæ*.)

Stove evergreen climber. Cuttings of firm side-shoots in sand, under a bell-glass, and in bottom-heat in May; sandy loam and fibry peat. Winter temp., 55° to 65°; summer, 60° to 85°.

S. guianensis. White. June. Guiana. 1827.

Singling. Thinning seedlings so that two do not touch each other.

Sinningia. (Named after W. Sinning, a German gardener. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*. Syns., *Biglandularia*, *Ligeria*, *Rosanovia*, and *Tapeinotes*.)

Stove evergreens. For culture, see GESNERA. The species of this genus are often erroneously referred to GLOXINIA.

S. barbatata. 1½. White, red. Summer. Brazil. 1867. Syn., *Tapeinotes Carolina*. B. M. t. 5623.

— *major*. A larger plant. III. Hort. n. s. t. 506.

— *concinna*. Purple, yellowish. Summer and autumn. Brazil. Syns., *Stenogaster concinna*, B. M. t. 5253 and *Stenogaster concinna*, Fl. Ser. t. 1533.

— *multiflora*. Bluish-lilac. III. Hort. 1864, t. 390.

— *conspicua*. 1. Yellow, purple. Brazil. 1868. Syn., *Biglandularia conspicua* and *Rosanovia conspicua*, Gf. t. 712. *Rosanovia ornata*, Fl. Ser. t. 2423, is a hybrid derived from this.

— *guttata*. 1½. Yellow, red. June. Brazil. 1827. B. R. t. 1112.

— *Helle'ri*. 1. White, green. June. Rio Janeiro. 1827. Syn., *S. velutina*, B. M. t. 4212.

- S. hirsuta*. 1. Bluish-lilac. July. Brazil. 1824. Syn., *Gloxinia hirsuta*. B. M. t. 2690.
- *Menzie'sii*. Violet, with red dots. August. Brazil. Syn., *Gloxinia speciosa*, var. *Menzie'sii*. B. M. t. 3943.
- *speciosa*. 1. Violet. September. Brazil. 1815. Syns., *Gloxinia Passinghamii*, Paxt. Mag. xii. p. 267, *G. speciosa*, B. M. t. 1987, and *Ligeria speciosa*. The garden forms of this species are extremely numerous.
- — *albiflora*. White. Syn., *Gloxinia speciosa*, var. *albiflora*. B. M. t. 3206.
- — *caulescens*. A taller plant than the type. 1826. Syn., *Gloxinia caulescens*. B. R. t. 1127.
- — *macrophylla*. Leaves large and with white veins. 1844. Syn., *Gloxinia speciosa*, var. *macrophylla variegata*.
- — *rubra*. Red. Syn., *Gloxinia rubra*. Paxt. Mag. vii. p. 271.
- — *velutina*. 1½. Pale greenish. June. Brazil. 1827. B. C. t. 1898. *S. velutina* of B. M. t. 4212 and B. R. t. 997 is *S. Helleri*.
- *villosa*. 1½. Yellow, green. June. Brazil. 1827. B. R. t. 1184.
- *Youngiana*. 1. Purple. June. Brazil. B. M. t. 4954. A hybrid between *S. speciosa* and *S. velutina*.

Siphocampylus. (From *siphon*, a tube, and *kampylos*, a curve; shape of the flower. Nat. ord., *Campanulaceae*; Tribe, *Lobeliae*.)

Cuttings root readily; those which are herbaceous are best struck from the young shoots, several inches in length, as they rise from the root in spring; *bicolor* and *betulaefolius* are hardy in sheltered places.

HARDY.

- S. betulaefolius*. 3. Red, yellow. July. Brazil. 1842. Deciduous. B. M. t. 3973.
- *bicolor*. Swt. Fl. Gard. ser. 2 t. 389. A synonym of *Lobelia laxiflora*, var. *angustifolia*.

GREENHOUSE EVERGREENS.

Siphonandra. (From *siphon*, a tube, and *aner*, a male. Nat. ord., *Rubiaceae*; Tribe, *Chiococceae*.) A synonym of **Chiococca**.

Siphonanthus. (From *siphon*, a tube, and *anthos*, a flower. Nat. ord., *Verbenaceae*; Tribe, *Viticeae*.) A synonym of **Clerodendron**.

Stove evergreen.

S. indica. See *Clerodendron Siphonanthus*.

Siphonia. (From *siphon*, a tube, or pipe. Nat. ord., *Euphorbiaceae*; Tribe, *Crotonae*.) A synonym of **Hevea**.

The Brazilian, or Bottle India-rubber is the produce of this shrub. Stove evergreen shrub. Cuttings of ripened shoots, dried at the base, inserted in sand, under a large glass, in bottom-heat; sandy, fibry loam, peat, and leaf-mould. Winter temp., 50° to 60°; summer, 60° to 85°.

S. Cahuchu. 6. Gniانا. 1823. This species and *S. elastica* are forms of **HEVEA GUIANENSIS**.

Sirex gigas. This insect so much resembles the hornet in general appearance as to be very frequently mistaken for it. In the summer months the *Sirex* may sometimes be seen flying briskly among Fir trees, or sitting on their trunks depositing its eggs. It is rather a formidable-looking insect, measuring an inch to an inch and a half in length. The head is black, with two yellow spots behind the eyes; the thorax is black; the abdomen is yellow, with a dark-brown central belt; the long ovipositor—which is often mistaken for a sting, though in this respect the insect is quite harmless—is reddish-brown; the legs and antennae are yellow, and the wings hyaline, with a yellowish tint. The insect deposits its eggs in either living or felled Fir trees. In doing this it elevates its body, and applies its ovipositor to the wood in a manner so as to form nearly a right angle with its body; it bores with the

sheath of its ovipositor to a considerable depth into the wood, and there deposits its eggs. The larva, when full grown, is rather more than an inch long; the head is furnished with strong jaws, and

the tail ends in a short spine. It burrows deep into the wood, forming long galleries, thereby doing considerable damage to the timber. At the termination of one of these galleries it changes to the pupa state, in which condition it sometimes remains for several years before the perfect insect emerges, which at times has to eat its way through a considerable thickness of wood before it can enjoy a free, winged existence. Another species of this genus, which is not uncommon, is *S. juvenis*; this has similar habits to *S. gigas*, from which it is distinguished by its smaller size, steel-blue body, and black antennæ. For the above engraving of *S. gigas*, we are indebted to the publishers of the *Gardeners' Chronicle*.

Sissoo Wood. *Dalbergia Si'ssoo*.

Sisymbrium. (A classical name for some plant. Nat. ord., *Cruciferae*; Tribe, *Sisymbrieæ*.)

Many species, all but on mere weeds. This is propagated by cuttings of young shoots in spring; does best with greenhouse treatment, but requires at least a cold pit in cold winters; common, sandy loam.

S. millefolium. 1½. Yellow. June. Canaries. 1779. Evergreen.

Sisyri'nchium. (From *sys*, a pig, and *rynchos*, a snout; swine grub out the roots for food. Nat. ord., *Irideæ*; Tribe, *Sisyrinchææ*. Syns., *Eriphilema* and *Hydastylus*.)

Herbaceous perennials. Seeds and offsets in spring; sandy loam and leaf-mould.

Sitones. A genus of weevils distinguished principally by their short, flat beak, which does considerable damage to various leguminous plants, especially to peas and clover. *Sitones lineatus* is about one-sixth of an inch long, of an ochraceous colour, with three whitish longitudinal stripes on the back, alternating with dotted stripes; the antennæ are reddish. It feeds greedily upon pea leaves, sometimes devouring almost the entire leaf. The maggots, which are white with brownish heads, are to be found on the roots of seedling peas. It is important to have the soil sufficiently rich to render the seedlings strong, as they are then better able to resist the attacks of these maggots. These insects also attack clover, and some of the weevils are known to hibernate in hollow corn stubble. Little is at present known as to the way of preventing their attack, but well rolling the ground has been found to diminish their numbers.

Sitones crinitus, the Spotted Pea Weevil, is smaller than *S. lineatus*, grey or rosy, and with black spots on the wing cases.

Si'um. (From *sin*, the Celtic for water. Nat. ord., *Umbelliferae*; Tribe, *Ammineæ*.)

All weeds, except the following. See SKIRRET.
S. sissarum. 1. White. August. China. 1548.

Skim'mia. (From *Skimmi*, the Japanese name. Nat. ord., *Rutaceæ*; Tribe, *Toddaliceæ*.)

Hardy evergreen shrubs, with shining leaves. Propagated from cuttings, and cultivated like the hardy evergreen *Daphnes*.

- S. Forema'nni*. Garden hybrid. 1888.
 — *fra'grans*. 3. White. April. Japan? 1880.

- S. oblata Veitchii*. 3. Dirty white. Spring 1880. Rev. Hort. 1880, p. 57.
 — *ovata*. Probably a garden form of *S. japonica*.
 — *rubella*. Greenish-white; buds red. China. 1874. Rev. Hort. 1880, p. 57.

Skinne'ra. (In honour of an Oxford botanist named *Skinner*, who flourished at the end of the eighteenth century. Nat. ord., *Onagraceæ*.) A synonym of **Fuchsia**.

S. excocticata. A synonym of *Fuchsia excocticata*.

Skinne'ria. (Named after *Captain Skinner*, a botanist. Nat. ord., *Convolvulaceæ*.) Now united with **Ipomæa**.

Stove herbaceous. Seeds in a hotbed, in spring; and cuttings of the young shoots in spring, in sandy, light soil, and in a sweet bottom-heat; rich, light fibry loam, and a little peat. Winter temp., 53° to 60°; summer, 60° to 85°.

- S. cæspitosa*. Yellow. May. E. Ind. 1827.
 Now known as *IPOMŒA LINIFOLIA*.

Skirret or Skirwort. (*Sivum sissarum*.) Sow at the end of March, or early in April, in drills a quarter of an inch deep, and twelve inches apart. Thin the plants to twelve inches apart. In autumn they will be fit for use like parsnips. *By Offsets*.—Old roots throw off these in the spring, when they may be slipped off, and planted in rows a foot apart each way. *Soil*.—A light, rich loam is best, trenched, with a little manure dug in with the bottom spit. *To save Seed*, let a few of the old roots run up in spring; they ripen their seed in the autumn.

Skull-cap. *Scutella'ria*.

Skunk Cabbage. *Symplocar'pus foetidus*.

Slevo'gtia. (After *J. Hadrian Slevogt*, 1653-1725, Professor of Anatomy at Jena. Nat. ord., *Gentianeæ*.)

Stove biennials. Sow in a hotbed in spring, or at the end of summer, and keep in a stove during winter to flower early the following year.
S. occidentalis. 1½. White. July. Trinidad 1817. Syn., *Hippion verticillatum*.

- *orientalis*. 1. Yellowish. July. E. Indies. 1825. Syn., *Hippion hyssopifolium*.

Slimy Grub. See **Selandria**.

Slipperwort. See **Calceolaria**.

Slips are young shoots torn off from the parent plant, so that they have a heel of older wood attached to them. (See **Cuttings** for culture.) *Slips*, also, is the name applied to the side beds of the kitchen, not immediately in contact with the walls or fences.

Sloa'nea. (In honour of *Sir Hans Sloane*, 1660-1753, founder of the British

Museum and the Chelsea Botanic Garden. Nat. ord., *Tiliaceæ*.)

Stove shrubs. Loam and peat. Cuttings of ripened wood, in sand, in heat.

S. dentata. 50. White. Autumn. Tropical America. 1752.

— *sinemariensis*. 50. White. July. Tropical America. 1820.

Sloe-tree. *Pru'nus spinosa*.

Slow-match Tree. *Careya arboresca*.

Slugs are of many species, and the smaller are much more injurious to the gardener than those of a larger size, because they are much less discernible, and their ravages being more gradual, are not at once detected. They are effectually destroyed by either salt or lime; and to secure the contact of these with their bodies, it is best first to water the soil where they harbour with lime-water in the evening when they are coming out to feed, sprinkling the surface at the same time with dry lime, and at the end of a week applying a surface-dressing of salt, at the rate of five bushels per acre. If cabbage-leaves are spread upon the surface of land infested by slugs, they will resort to their under sides, and thus they may be trapped; but lime and salt are most efficacious. Lime-water may be poured over wall-trees infested with them, and they may be syringed with it as well as with water in which gas liquor has been mixed, about half a pint to a gallon. If lime be sprinkled along the top and at the base of the wall, renewing it weekly, the slugs cannot get to the trees. Fresh brewers' grains, placed in small heaps, are good traps for them; and frequent earth-stirring helps to banish them.

Smeathmannia. (Named after *Smeathmann*, an African traveller. Nat. ord., *Passifloraceæ*; Tribe, *Passifloree*.)

Stove, white-flowered evergreens, from Sierra Leone. Cuttings of ripened shoots, or short, stubby side-shoots, in sand, under a bell-glass, and in bottom-heat; sandy, fibry loam, and lumpy peat. Winter temp., 55° to 60°; summer, 60° to 85°.

S. emarginata. 1851.

— *lavigata*. 6. February. 1823. B. M. t. 4194.

— *pudraeana*. 10. February. B. M. t. 4364.

— *rosea*. Red. 1851.

Smelowskia. (After *T. Smelowski*, a Russian botanist at the beginning of this century. Nat. ord., *Cruciferae*; Tribe, *Thlaspidæ*.)

Hardy, herbaceous perennial. Sandy loam, mixed with a little peat or leaf-mould. Seeds, or divisions in spring.

S. calycina. ½. White. April. Siberia. 1823. Syn., *Hutchinsia calycina*.

Smilacina. (Diminutive of *Smilax*,

from *smile*, a scraper; referring to the rough stems. Nat. ord., *Liliaceæ*; Tribe, *Polygonateæ*.)

Hardy herbaceous, white-flowered, and from North America, except where otherwise specified. Divisions in spring; common, light soil.

S. amoëna. See *S. paniculata*.

— *bifolia*. A synonym of *Maianthemum biflorum*.

— *borealis* of B. M. t. 1403, see *Clintonia borealis*; of B. M. t. 1155, see *Clintonia umbellata*.

— *canadensis*. ½. June. 1812. Now known as *Maianthemum Canadaria*.

— *ciliata*. See *S. racemosa*.

— *paniculata*. 4. Green. May. Guatemala. 1850. Syn., *S. amoëna*.

— *racemosa*. 1. Pale yellow. May. 1649. Red. Lil. t. 230. Syn., *S. ciliata* and *Convallaria racemosa*, B. M. t. 899.

— *ramosa*. 2. Pale yellow. May. Siberia. 1820.

— *stellata*. ½. May. 1633. Red. Lil. t. 185. Syn., *Convallaria stellata*, B. M. t. 1043.

— *trifolia*. ½. June. 1812.

— *umbellata*. See *Clintonia umbellata*.

— *uniflora*. See *Clintonia uniflora*.

Smilax. (From *smile*, a scraper; rough, prickly stems. Nat. ord., *Liliaceæ*; Tribe, *Smilaceæ*.)

Sarsaparilla is the produce of many species of *Smilax*. There are many species, but only the following require our notice, which have whitish-green flowers. Suckers from the roots; sandy, rich loam, and a little peat. They are evergreen climbers, seldom flowering. One of the most beautiful is *rubens*, from the red colour of its tendrils. The species from China should have the protection of a cold pit or a wall.

S. aspera. 8. September. S. Europe. 1648.

— *angustifolia*. 1½. September. China. 1820. Syn., *S. sagittifolia*, B. C. t. 1799.

— *auritica*. Greenish-yellow. 1884. Half-hardy.

— *punctata*. Leaves spotted with white. Gf. t. 683.

— *asperifolia*. A doubtful plant.

— *auriculata*. Southern United States. 1834.

— *australis*. 5. Summer. Australia. 1791. Syn., *S. latifolia*.

— *Boëna-nôx*. 5-10. July. North America. 1739. Syn., *S. tamnoides*.

 Syn., *S. quadrangularis*.
 — *rubens*. See *S. Bona-nox*, var. *rubens*.
 — *sagittifolia*. See *S. aspera*, var. *angustifolia*.
 — *salicifolia variegata*. Leaves long, variegated with white. Para. 1867. Greenhouse.
 Syn., *S. longifolia*, var. *variegata*, III. Hort. t. 521.
 — *Sarsaparilla*. Several species have been grown under this name. That of Wats. Dendr. t. 111 is *S. glauca*.
 — *Shuttleworthii*. Leaves green, blotched with grey. Columbia. 1877.
 — *tamnoides*. See *S. Bona-nox*.
 — *Waltherii*. Virginia.
 — *Watsoni*. 4. July. North America. 1811.

Smithia. (In honour of *Sir James Edward Smith*, 1759-1828, founder of the Linnaean Society, and author of many botanical works. Nat. ord., *Leguminosae*; Tribe, *Hedysareae*.)

Stove annual, requiring the same culture as MIMOSA.

S. purpurea. ½-1. Purple, with white spots. Summer. East Indies. 1848. B. M. t. 4283.

Smoke Plant. *Rhus Cotinus*.

Smoke-wood. *Cle'matis Vitalba*.

Smooth Flower. *Leianthus longifolius*.

Smooth-fruited Horse Chestnut. *Pavia*.

Smut. A popular name for the *Ustilagineae*, a group of microscopic fungi which infest many plants, especially cereals. They are developed within the tissues of their hosts, and when ripe burst out in the form of a sooty powder (spores), whence the name.

Snails. See **Slugs**.

Snail Flower. *Phaseolus caracalla*.

Snake Gourd. *Trichosanthes anguina*.

Snake Plant. *Dracunculus vulgaris*.

Snake Root. *Aristolochia serpentaria*.

Snake's Beard. *Ophiopogon*.

Snake's Head. *Fritillaria meleagris* and *Iris tuberosa*.

Snake's Mouth Orchid. *Pogonia ophioglossoides*.

Snake's Tongue. *Ophioglossum*.

Snake-weed. *Polygonum bistorta*.

Snake Wood. *Cecropia* and *Strychnos colubrina*.

Snapdragon. *Antirrhinum*.

Snapweed. *Impatiens*.

Sneezewort. *Achillea Ptarmica*.

Snow is one of the gardener's best shelters, and should never be removed from his out-door crops. It prevents heat from radiating from them; protects them from freezing, drying blasts, and, being a bad conductor of heat, thus prevents its escape from them. We have never known the surface of the earth, below a covering of snow, colder than 32°, even when the temperature of the air above has been 28°.

Snowball Tree. *Viburnum opulus*.

Snowberry. *Chiococca* and *Symphoricarpos racemosus*.

Snowdrop. *Galanthus nivalis* and *Anemone sylvestris*.

Snowdrop Tree. *Halesia tetraptera*.

Snowdrop-tree, African. *Royena lucida*.

Snowdrop Windflower. *Anemone sylvestris*.

Snowflake. *Leucjum*.

Snow Flower. *Chionanthus*.

Snow Glory. *Chionodoxa lucifera*.

Snow in Summer. *Cerastium tomentosum*.

Snow Pear. *Pyrus sinensis*.

Snow Tree. *Pyrus nivalis*.

Snowy Fly. *Aleyrodes prolella*.

Soap-boiler's Ashes. See **Ashes**.

Soap-plant. *Chlorogalum pomeridianum*.

Soap Tree. *Gymnocladus chinensis*.

Soapwort. *Sapona'ria*.

Sobra'lia. (Named after *F. M. Sobral*, a Spanish botanist. Nat. ord., *Orchideae*; Tribe, *Neottieae-Vanilleae*.)

Stove orchids, grown in pots. See **ORCHIDS**.

S. Cattleya. Purplish-brown, yellow. Columbia. 1877.

 — — *alba*. Pale primrose-yellow. 1889.

Soil. Every soil is composed of silica, alumina, lime, magnesia, oxide of iron, salts, and animal and vegetable remains, and the different kinds of soil depend upon the varying proportion of these ingredients. A fertile soil is one which contains such a proportion of decomposing matter and of moisture as to keep the crop growing upon it always supplied with food in a state fit for the roots to absorb, yet not so superabundantly as to render the plants too luxuriant, if the object in view is the production of seed; but for the production of those plants whose foliage is the part in request, as spinach, or of edible bulbs, as onions, which have a small expanse of leaves, so as to be almost entirely dependent upon the soil for nourishment, there can scarcely be an excess of decomposed matter presented to their roots.

A *subsoil* of gravel, mixed with clay, is the best, if not abounding in oxide of iron; for clay alone retains the moisture on the arable surface in too great amount; and sand or chalk, on the contrary, allows it to pass away too rapidly. It is, however, evident, that to insure these desiderata in any soil, at all seasons, is impossible; and it is manifest that a soil that would do so in one climate would fail in another, if the mean annual temperature of them should differ, as well as the amount in inches of rain which falls during the same period. Thus, in the western parts of England, more than twice as much rain occurs as in the most eastern counties, or in the proportion of forty-two to nineteen. A soil in the east of England, for any given crop, therefore, may be richer and more tenacious than the soil required for it on the western coast.

Alumina (clay) imparts tenacity to a soil when applied; silica (sand) diminishes that power; whilst chalk and lime have an intermediate effect. They render heavy soils more friable, light soils more retentive. These simple facts are important; two neighbouring gardens, by an interchange of soils, being often rendered fertile, which before were in the extremes of tenacity and porosity.

In affording warmth to plants, the earth is of considerable importance, and the power of accumulating and retaining heat varies as much in soils as the proportions of their constituents. Sir Humphry Davy found that a rich black mould, containing one-fourth of vegetable matter, had its temperature increased, in an hour, from 65° to 88° by exposure to the sunshine, whilst a chalk soil was heated only to 69° under similar circumstances. But the first, when removed into the shade, cooled in half an hour 15°; whereas the latter lost only 4°. This explains why the crops on light-coloured, tenacious soils are in general so much more backward in spring, but are retained longer in verdure, during autumn, than those on black, light soils; the latter attain a genial warmth the more readily, but part from it with equal speed.

The quantity of soluble matter obtainable from a soil at any one time is very small, seldom exceeding a one-thousandth part of its weight; and even pure vegetable mould, the *débris* of entirely putrefied plants, was found by Saussure to yield only one-eleventh of soluble matter. This mould was too rich for horticultural purposes, peas and beans grown in it being too luxuriant; and they were more productive in a soil containing only one-twentieth of organic constituents soluble in water. Small in amount, however, as are the soluble constituents of the most fertile soils, they are necessary for the vigorous vegetation of plants; for when a soil is deprived of those constituents by frequent washings with boiling water, it is much less fertile than before. Liebig and others have concluded, from the smallness of the soluble extract contained in a soil, that it is of small importance, forgetting that as fast as it is taken by the roots of the crop, it is generated again by the decomposition of the animal and vegetable remains. This is one reason why fallowing is beneficial. Easily decomposing matters have been exhausted by successive crops; and by a year's rest, and exposure to the putrefactive agency of the air, the more stubborn and more slowly decomposing

matters have time to decay and accumulate in the soil. It is now established that plants are not dependent for food on the matter already in a state of solution in the soil, but that some, at least, of them can, by an acid excretion from their rootlets, dissolve substances (e.g. carbonate of lime, magnesia, etc.) not soluble in water, and so utilize them as food.

Soiling-up. See **Basing-up** and **Earthing-up.**

So'ja. (From *sooja*, the name of a sauce made from the seeds in Japan. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Dolichos*.) Now united to **Glycine**.

Climbing annual. Seeds in May, in the open border, or in a slight hotbed in April, and transplanted.

S. hispida. 3. Violet. July. E. Indies. 1790. Syn., *Dolichos Soja*. The correct name of this is **GLYCINE HISPIDA**.

Sola'ndra. (Named after *Dr. Solander*, a Swedish botanist. Nat. ord., *Solanaceæ*; Tribe, *Atropeæ*.)

Stove evergreen shrubs. Cuttings from flowering shoots in open, sandy loam, and in a brisk bottom-heat; sandy loam, a little fibry peat, and dried nodules of old cow-dung. Winter temp., 50° to 60°, and almost dry; summer, 60° to 90°, and plenty of moisture when growing.

S. grandiflora. 15. Pale yellow. May. Jamaica. 1781. Climber.

— *gutta'ta*. 12. Pale yellow. Mexico. 1830.

— *le'vis*. 2. White. October. B. M. t. 4345.

— *ni'tida*. 20. Yellowish-white. E. Indies. 1829.

— *oppositi'folia*. 10. White. Ceylon. 1820.

— *viridi'flora*. B. M. t. 1948. See *Dysochroma viridiflora*.

Sola'num. Nightshade. (From *solor*, to comfort; soothing narcotic effect. Nat. ord., *Solanaceæ*; Tribe, *Solanææ*.)

All freely by seeds. Annuals, hardy, seeds in the open air; tender, in a hotbed, and transplanted in June; herbaceous, by similar means, and division; shrubby, by similar modes, and cuttings under a bell-glass, and requiring the protection of a house and temperature, in proportion to the place of which they are natives. A review of the tuber-bearing species of this genus, by J. G. Baker, F.R.S., is published in the *Journal of the Linnean Society (Botany)*, vol. xx. p. 489, plates 41-46. See **POTATO**.

- Solaria**. (Named in honour of *Francisci de Borja Solar*, an eminent Chilean mathematician. Nat. ord., *Liliaceae*; Tribe, *Allieae*.)
 A remarkable greenhouse bulb. Seeds, offsets.

Sandy loam and leaf-mould; keep the bulbs nearly dry during their period of rest, and gradually diminish the quantity of water given when the leaves begin to die down. Summer temp., 60° to 80°; winter, 40° to 50°.

S. miersioides. †. Green. Chili. 1871. Syn., *Symea gillesioides*. Ref. Bot. t. 260.

Soldana *lla*. (A diminutive of *solidus*, a piece of money; shape of the leaves. Nat. ord., *Primulaceæ*; Tribe, *Primulææ*. Allied to the American Cowslip.)

Half-hardy herbaceous perennials, purple-flowered, and blooming in April, except where otherwise mentioned. Seeds and division of the plant in spring; peat and loam; front of a sheltered peat-border, or treated as alpine plants, protected from severe frosts and heavy rains in winter; *mi'nima* and *pusi'lla*, at least, require this protection.

S. affi'nis. See *S. montana*.
— *alpi'na*. †. Switzerland. 1656. B. M. t. 49. Syn., *S. Clusii* of B. M. t. 2163.

— *pusi'lla*. †. Blue. Switzerland. 1820. Syn., *S. Clusii* of B. C. t. 872.

Soldier-wood. *Inga purpurea*.

Solea. (After *W. Sole*, an apothecary of Bath, who published a monograph of the British Mints in 1798. Nat. ord., *Violaceæ*.) A synonym of **Ionidium**.

S. stri'cta. See *Ionidium Sprengelianum*.
— *verticilla'ta*. See *Ionidium polygalæfolium*.

Sole'na. (From *solen*, a pipe or tube; in allusion to the long tube of the corolla. Nat. ord., *Rubiaceæ*; Tribe, *Gardeniææ*.) A synonym of **Posoqueria**.

S. gra'cilis. See *Posoqueria gracilis*.
— *longifo'ra*. See *Posoqueria longiflora*.

Soleni'dium. (From *solen*, a tube. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*. Allied to Brassia.)

Stove orchid, grown on a block. See ORCHIDS.
S. racem'o'sum. Yellow, red. November. Pamplona. Paxt. Fl. Gard. t. 102.

Solenomelos. (From *solen*, a tube, and *melos*, a limb; the perianth is tubular. Nat. ord., *Iridææ*; Tribe, *Sisyrinchieæ*.)

Half-hardy bulbs. For culture, see SISYRINCHIUM.

S. bisfo'rus. White. June. South America. 1828. Syn., *Sisyrinchium odoratissimum*.
— *chile'nsis*. 1. Yellow. September. Chili. 1827. Syns., *Sisyrinchium longistylum*, Fl. Ser. t. 255, and *S. pedunculatum*, B. M. t. 2965.

Solenophora. (From *solen*, a tube, and *pherein*, to bear; the corolla is tubular. Nat. ord., *Gesneraceæ*. Syn., *Arctocalyx*.)

Stove, evergreen shrub. For culture, see GLOXINIA.

S. Endlicheria'na. 2. Orange, marked with purple. April. Mexico. 1849. Syn., *Arctocalyx Endlicherianus*, Fl. Ser. t. 546.

Solida'go. Golden Rod. (From *solidare*, to unite; supposed healing properties. Nat. ord., *Compositæ*; Tribe, *Asteroidææ*.)

Hardy herbaceous perennials, all yellow-flowered, and all from North America, where not otherwise noticed. Divisions of the plant in spring; common soil. Showy at the back of herbaceous borders, or the back rows of herbaceous plants in the front of shrubberies.

So'llya. (Named after *R. H. Solly*, a naturalist. Nat. ord., *Pittosporaceæ*.)

Greenhouse, blue-flowered, evergreen climbers, from Australia. Seeds in a slight hotbed, in April; cuttings at the same time of young shoots a little firm at the base, in sand, under a bell-glass, and placed in a cold pit, when the night temperature does not exceed from 45° to 50°; loam and peat. Winter temp., 40° to 45°. Most of them would succeed against a conservatory wall.

 — *stricta*. $\frac{1}{2}$. Rose. May. Java. 1848. B. M. t. 4394.

Sonnera'tia. (Named after *M. Sonnerat*, a European traveller. Nat. ord., *Lythrariceæ*; Tribe, *Lythraceæ*.)

Stove evergreen shrubs, from the East Indies. Cuttings of half-ripened shoots, taken off with a heel, in sand, under a bell-glass, and placed in a mild hotbed in May; fibry loam, turfy peat, a little sand, and dried old cow-dung. Winter temp., 45° to 55°; summer, 60° to 85°.

- S. a'ida*. Red. June. 1822. Wight, Ic. t. 340.
 — *alba*. White. May. 1824.
 — *apetala*. 40. White. June. 1826.

Soot is the volatilized unconsumed portion of common coal. It is thus constituted:—Charcoal, 371; salts of ammonia, 426; salts of potash and soda, 24; oxide of iron, 50; silica, 65; alumina, 31; sulphate of lime, 31; carbonate of magnesia, 2. It is an excellent manure for peas, onions, carrots, and probably all garden crops. An excellent liquid-manure is soot mixed with rain-water, in the proportion of one table-spoonful of soot to a quart of water, for plants in pots; but for asparagus, peas, etc., six quarts of soot to a hogshead of water. It must never be applied to plants in a state of rest. It succeeds admirably with bulbs. See **Liquid-manures**.

So'phora. (From the Arabic name, *Sophora*, of a leguminous tree. Nat. ord., *Leguminosæ*; Tribe, *Sophoreæ*.)

Hardy herbaceous kinds by divisions in spring; stove and greenhouse species, by cuttings of half-ripened shoots under a bell-glass, in sand, and grown in peat and loam. The hardy kinds, such as *japonica* and its varieties, are very ornamental trees on a lawn, but should be grown in poor soil north of London, that the annual growth may be well-ripened; propagated by imported seeds, by cuttings of the roots, and layers; its varieties by grafting. The variety *pe'ndula* is extremely graceful and fast growing.

HARDY HERBACEOUS.

Sorghum. Millet Grass. (From the Indian name, *Sorgh*i. Nat. ord., *Gramineæ*; Tribe, *Andropogoneæ*.)

Half-hardy, or greenhouse, perennial grass. Seeds or divisions.

- S. halepense*. $\frac{1}{2}$. Purplish. Mediterranean region.

Sorindei'a. (From the Malagasy name. Nat. ord., *Anacardiaceæ*.)

A small stove tree. For culture, see ANACARDIUM.

- S. madagascariensis*. 10. Purple. May. Madagascar. 1828.

Soroce'phalus. (From *soros*, a heap, and *kephale*, a head; clustered head of flowers. Nat. ord., *Proteaceæ*; Tribe, *Protea*.)

Greenhouse, purple-flowered evergreens, from South Africa. Cuttings of ripened young shoots in sand, under a hand-light, either in spring or autumn; may be hastened, after the base has swelled, with a little bottom-heat; sandy, fibry loam, and a little peat and broken freestone, carefully drained. Winter temp., 38° to 45°.

- S. diversiflorus*. 4. June. 1803.
— *imberbis*. 3. July. 1804.
— *imbricat*us. 3. June. 1794. Syn., *Protea imbricata*. Andr. Rep. t. 517.
— *lanatus*. 2. August. 1790.
— *setaceus*. 2. July. 1823.
— *spatalloides*. 3. July. 1803.
— *tenuiflorus*. 3. July. 1802.

Soroma'nes. (From *soros*, a heap, and *mania*, uncontrollable propensity; alluding to its excessive production of sori. Nat. ord., *Filices—Polypodiaceæ*.) Now united with **Acrostichum**.

Stove ferns. See FERNS.

- S. serratifolium*. 2. Venezuela.

Sorrels. These are *Oxalis acetosella*, Wood Sorrel; *Rumex acetosa*, Garden Sorrel; *R. scutellatus*, French or Roman Sorrel. They thrive best in any light, rich garden-soil.

The species of *Rumex* are propagated by seed, and all of them by parting the roots, both of which modes may be practised from the middle of February until the same period in May, and by parting the roots in September and October. Sow in drills, six or eight inches apart, and a quarter-inch in depth. When two or three inches high, the seedlings should be thinned to three or four inches apart. In September or October, or in the

March and April of the succeeding year, they may be removed into their final stations, in rows twelve inches apart each way, or, if the French, eighteen inches.

When divisions of the root are employed, they must be set at once where they are to remain, at the final distances above mentioned. In summer, the stalks must be cut down, to encourage the production of leaves. In autumn and spring the surface of the ground should be gently stirred, and a little manure turned in.

To obtain Seed.—Some plants must not be gathered from, but be allowed to run up unchecked. They flower in the course of June, July, and August, perfecting their seed in autumn. Wood Sorrel does not produce seed readily.

Sorrel-tree. *Oxydendron arborescens.*

Sorrowful-tree. *Nyctanthes arbor-tristis.*

Sorus. The name given to the fructification of Ferns. It is generally situated on the under-surface of the frond, and consists of a number of stalked bodies (*sporangia*) containing minute, dust-like spores, which are liberated when ripe and serve to reproduce the plant. These sori are sometimes covered by a scale (*indusium*), the shape of which serves to distinguish the genera; in *Nephrodium* it is reniform, in *Aspidium* circular and attached by its centre, in *Asplenium* elongate, in *Pteris* and *Adiantum* it is formed from the recurved margin of the frond, and in *Polypodium* absent. In *Hymenophyllum* and *Trichomanes* the sorus is cup-shaped and situated at the apex of a segment of the frond.

Suari Nut-tree. *Ca'ryocar nuciferum.*

Soula'ngia. (Named after *Soulanges Bodin*, a French nurseryman. Nat. ord., *Rhamnaceæ*; Tribe, *Rhamneæ*.) A synonym of *Phytica*.

Greenhouse evergreen shrubs, from South Africa. Cuttings of the points of shoots in sand, under a bell-glass, in April or May; sandy, fibry peat, and a few bits of charcoal, to keep it open. Winter temp., 33° to 45°. Should be tried against a wall in the open air, in dry places and mild situations.

S. buxifolia. See *Phytica buxifolia*.
—*cordata.* See *Phytica cordata*.
—*dioica.* See *Phytica dioica*.
—*myrtifolia.* See *Phytica myrtifolia*.
—*rubra.* B. R. t. 1498. See *Phytica purpurea*.
—*thymifolia.* See *Phytica thymifolia*.

Sour is a term applied to wet lands producing acid weeds, such as Sorrel;

but it is also appropriate because such lands contain Gallie and other acid compounds, unfriendly to cultivated plants.

Sour Gourd. *Adansonia digitata.*

Sour Sop or Custard Apple. *Anona muricata.*

South African Yellow Wood. *Podocarpus elongata.*

Southern Wood. *Artemisia Abrotanum.*

South Sea Tea. *Ilex vomitoria.*

Sowbread. *Cyclamen.*

Sowerbæ'a. (Named after *Mr. Sowerby*, an eminent botanical artist. Nat. ord., *Liliaceæ*; Tribe, *Johnsoniæ*.)

Half-hardy, pink-flowered, herbaceous perennials, from New South Wales. Divisions of the plant in spring; loam and sandy peat, or old leaf-mould. Require the protection of a cold pit in winter and to be kept dryish.

S. juncea. 1. May. 1792. Linn. Trans. v. t. 6; B. M. t. 1104.

—*laxiflora.* 1. June. 1839. B. R. 1841, t. 10.

Sowing. (See *Germination*.) In addition, a few practical directions may be given. Let all sowing be done in drills. For small seeds, such as lettuce, cabbage, etc., the drills may be sunk by pressing the handle of the hoe into freshly-dug soil; but for larger seeds, as parsnips, beet, and onions, the drills must be struck with the hoe. Almost all sowing should be performed in dry weather, more particularly all early sowing in winter and spring; but in hot weather, in summer and autumn, it may often be better to take advantage of sowing immediately after a shower of moderate rain.

The drills being at some distance from one another, not only admit the sun, air, and rain more effectually to the plants, and give them a greater scope than such as are sown broadcast, but admit more readily the hoe between the drills to cut down weeds and loosen the soil.

The general method of forming drills for the reception of seeds is with a common drawing-hoe, sometimes with a large hoe, and sometimes a middling or small hoe, according to the size of the drill required, and the size and nature of the seeds; drawing the drill sometimes with the corner of the hoe, especially for larger seeds, and sometimes with the edge of the hoe flatwise, or horizontally. Large seeds, such as peas, kidney beans, many of the nut kinds, and other large seeds, both of trees, shrubs, and herbaceous plants, require a deep angular drill, drawn with the corner of the hoe,

turning the face or edge close to the line, and drawing the drill along evenly with an angular bottom the depth required, the earth remaining close along the side of the drill, ready for turning in again over the seeds; but where flat or shallow drills are required for smaller seeds, it may, in many cases, be better to draw the drill with the hoe flatwise, holding the edge in a horizontal position.

Bedding-in Sowing.—In this method, the ground being dug and formed in beds four or five feet wide, with alleys a spade width or more between bed and bed, and the earth being drawn off the top of the bed with a rake or spade, half an inch or an inch deep into the alleys, the seed is then sown all over the surface of the bed which being done, the earth in the alleys is immediately drawn or cast over the bed, again covering the seeds the same depth, and the surface is raked smooth.

The method of bedding-in sowing by sifting is sometimes practised for very small or light seeds of a more delicate nature, that require a very light covering of earth when sown. In order to bury them as shallow as possible, cover them in by sifting fine earth over them out of a wire sieve.

Soy. See **Glyci'ne.**

Spade. This most important of the gardener's tools varies in its form and size. *The Common Digging Spade* is of the largest size, being generally from fourteen to sixteen inches long in the plate, and nine or ten broad, narrowing half an inch to the bottom. *The Middle Spade* is about a foot long in the plate, and seven or eight inches broad, and is useful in digging any narrow compartments and between rows of small plants; also in flower-beds and borders, and in stirring and fresh earthing the surface of beds occasionally between close-placed plants of long standing; planting and transplanting many sorts, both in the ground and in the pots.

The Small Spade.—Size ten or twelve inches long in the plate, and five or six wide is convenient in pointing-up or slight digging, and fresh earthing the surface between closerows of small plants, in beds and borders, etc., where neither of the two former spades can be readily introduced; likewise in planting and potting many sorts of small plants, taking up small roots, and for other light purposes. Proper garden spades have the plate wholly of iron, not above a quarter of an inch thick upwards, growing gradually thinner from the middle

downward, the tree or handle being generally of ash, about two feet and a half long and an inch and a half thick, with a firm, open handle at top, formed out of the solid wood, just big enough to admit of taking ready hold, one hand at top and the other below, and with an iron rivet through it to prevent it slipping. *Semicircular* or *Scoped Spade* has the plate made semicircular, like a garden trowel, and is very useful in taking up plants with balls of earth, to preserve them more firmly about the roots.

Spado'styles. (Derivation not explained. Nat. ord., *Leguminosæ*; Tribe, *Podalyriæ*.) Now united with **Pultenæa**.

Greenhouse evergreen shrub. For culture, see **PULTENÆA**.

S. Sieber'i. 2. Yellow. May. N. S. Wales. 1824. A synonym of *Pultenæa euhila*.

Spanish Bluebell or **Squill.**

Sci'lla hisp'ánica.

Sparma'nnia. (Named after A. Sparmann, a Swedish botanist. Nat. ord., *Tiliaceæ*; Tribe, *Tiliceæ*.)

A fine old greenhouse evergreen shrub. Cuttings of young shoots in April; loam and a little peat. Winter temp., 38° to 48°.

S. africa'na. 10. White. May. South Africa. 1790. B. M. t. 516. Syn., *S. acerifolia*.

Spartium. Spanish Broom. (From *sparton*, cordage; alluding to the flexible shoots. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*. Allied to *Genista*.)

Hardy herbaceous, yellow-flowered shrubs. Generally by seeds, but cuttings will strike freely in summer under a hand-light; and this is the best mode for securing a particular variety. They should be planted out young, or be frequently moved, as they make long, naked stems; common, light soil.

- S. acutifolium*. B. R. t. 1974. A synonym of *S. junceum*.

Spartotha'mnus. (From *sparton*, cordage, and *thamnus*, a shrub; its flexible shoots. Nat. ord., *Verbenacæ*; Tribe, *Chloantheæ*.)

Greenhouse evergreen shrub. Cuttings of young shoots under a bell-glass, in sandy soil; sandy, fibry peat, and lumpy loam. Winter temp., 38° to 45°.

S. ju'nceus. 3. White. August. Australia. 1819.

Spatala'nthus. (From *spatalos*, delicate, and *anthos*, a flower. Nat. ord., *Irideæ*; Tribe, *Sisyrinchicæ*.) A synonym of **Romulea**.

A very rare and delicate Cape bulb, requiring one-half sand and one-half good, turfy peat, in a well-drained pot, after the manner of *Lxias*.

S. speciosus. Swt. Fl. Gard. t. 300. See *Romulea speciosa*.

Spatal'la. (From *spatalos*, delicate; the flowers are fragile. Nat. ord., *Proteaceæ*; Tribe, *Proteeæ*.)

Greenhouse, purple-flowered evergreens, from South Africa. Cuttings of ripe young shoots in sand, under a bell-glass, and kept cool; sandy, fibry loam, with pieces of charcoal and freestone; drainage and watering very particularly attended to. Winter temp., 38° to 45°. Pots defenced from sun in summer.

- *Thunbe'rgii*. 3. May. 1806.

Spatha'nthem. (From *spathe*, a spathe, and *anthos*, a flower; the flowers are seated on the midrib of the spathe. Nat. ord., *Aroideæ*; Tribe, *Spathicarpææ*. Allied to *Spathicarpa*.)

Greenhouse tuberous-rooted perennial. Offsets and division of the tubers. Rich loam and peat, well-drained; give plenty of water when growing, and place in the warmest part of the house. It requires to rest in winter like *CALADIUM*, *ARISÆMA*, etc. Summer temp., 60° to 85°; winter, 55° to 60°.

S. hetera'ndra. 1½. Spathe and spadix green. Tropical America. 1876. Syn., *Gamochlamys heterandra*. Ref. Bot. t. 346.

Spathe. A large bract, which incloses the whole inflorescence in bud, as in Palms and Aroids.

Spathe'lia. (From *spathe*, a sheath, or *spathe*, as in the Palm; resemblance. Nat. ord., *Simarubææ*; Tribe, *Picramniææ*.)

Stove evergreen tree. Cuttings of ripened shoots in sand, under a glass, in heat; loam and peat. Winter temp., 50° to 60°; summer, 60° to 85°.

S. simplex. 40. Red. Jamaica. 1778.

Spathica'rpa. (From *spathe*, a spathe, and *karpos*, fruit; the ovaries are seated along the midrib of the spathe. Nat. ord., *Aroideæ*; Tribe, *Spathicarpeææ*.)

Stove evergreen herbs, with tuberous root-stock. By divisions and seeds. Rich sandy loam. Summer temp., 80° to 90°; winter, 60° to 75°.

S. cornuta. 1. Green. Brazil. 1860.

— hastifolia. 1. White. July. South Brazil. 1831. Hook. Bot. Misc. t. 77.

— longicaulis. 1. Green. Brazil. 1860.

— platyspatha. $\frac{1}{2}$ -1. Green. Brazil. 1860.

— sagittifolia. $\frac{1}{2}$ -1. Green. Brazil. 1860.

Spathiphy'llum. (From *spathe*, a spathe, and *phyllon*, a leaf; spathe leaf-like. Nat. ord., *Aroideæ*; Tribe, *Arontiacææ*.)

Stove evergreen herbaceous perennials. Seeds sown in a hotbed; but chiefly by divisions of the rootstock. Peat and leaf-mould in equal parts, mixed with a little loam and bits of charcoal. They require plenty of water and the atmosphere must be moist. For decorative purposes some of the smaller species, such as *floribundum*, *Patini*, *candidum*, and *cannaefolium*, are very useful, and form a very effective contrast with *ANTHURIUM Scherzerianum* or *A. Andreanum*. Summer temp., 65° to 85°; winter, 60° to 70°.

S. candidum. $\frac{3}{4}$. Spathe and spadix white. Columbia. 1875. Syns. *Anthurium candidum* and *Massowia Gardneri*.

— cannaefolium. 1. Spathe and spadix white. W. Indies and Columbia. Syns., *Anthurium Dechardi* and *Pothos cannaefolia*. B. M. t. 608; B. C. t. 471.

— commutatum. 2 $\frac{1}{2}$. Spathe and spadix white. Philippines. 1870. Syn., *S. Minahasææ*.

— floribundum. 1. White. New Grenada. 1874. Syn., *Anthurium floribundum*. Ill. Hort. 1877, t. 159.

— heliconiaefolium. 4. Spathe green; spadix white. Peru.

— hybridum. A hybrid between *S. cannaefolium* and *S. Patini*. Ill. Hort. t. 450.

— lancefolium. Greenish. Venezuela. Syn., *Dracontium lancefolium*. Jacq. Ic. t. 612.

— Minahasææ. See *S. commutatum*.

— Ortigiesii. 1 $\frac{1}{2}$. Spathe light green; spadix white. July and December. Mexico. 1873.

— Patini. $\frac{3}{4}$. White. Columbia. 1874. Syns., *Anthurium Patini* and *Amomophyllum Patini*.

— pictum. Leaves mottled with golden green. S. America. 1874.

— Wallisii. See *Stenospermatium Wallisii*.

Spatho'dea. (From *spathe*, a sheath; sheath, or spathe-like calyx. Nat. ord., *Bignoniaceææ*; Tribe, *Tecomeææ*.)

Cuttings of side-shoots, three or four inches in length, taken off with a heel, as growth is proceeding, in spring, inserted thinly in sand, under

a bell-glass, and in a sweet bottom-heat; peat and loam. Winter temp., 50° to 60°; summer, 60° to 80°.

STOVE EVERGREEN CLIMBERS.

S. bracteosa. 8. White. Guiana. 1823.

— fraxinifolia. 10. Caraccas. 1822. Syn.,

Bignonia fraxinifolia.

— uncata. 10. Yellow. Guiana. 1804. Syn.,

Bignonia uncata.

STOVE EVERGREEN TREES.

B. M. t. 7013. Syn., *S. Augustorum*.

Land. t. 25.

Spawn is the underground vegetative part of the mushroom. It consists of numerous whitish, much-branched threads (*hyphae*), from which, under favourable conditions, the mushrooms arise. It is not seed as is sometimes erroneously supposed, but corresponds more to an underground stem. It originates from the minute dust-like spores formed on the under surface of the mature mushroom. See **Mushroom**.

Specula'ria. (From the ancient name, *Sp'culum Veneris*, or *Venus'* Looking-glass. Nat. ord., *Campanulacææ*; Tribe, *Campanuleææ*.)

Annuals and all others, by seeds in pans, in a bed, under glass, in March and April; division of the herbaceous kinds in spring, and cuttings

of young shoots under a hand-light, in a shady place, in summer; cuttings of shrubby kinds under a glass, in sandy soil, in April; sandy loam, with a little peat, or reduced dried leaf-mould, for shrubby. Winter temp., 40° to 48°.

GREENHOUSE EVERGREENS.

S. diffusa. Blue. August. Cape of Good Hope. 1787.
— *fruticosa*. 1. Blue. August. Cape of Good Hope. 1787.

GREENHOUSE HERBACEOUS.

S. interrupta. 1. Blue. June. Cape of Good Hope. 1818. Syn., *Campanula interrupta*.

— — *calycina*. July. Iberia.
— — *libanica*. July.
— — *pubescens*. July. France. Syn., *Prismatocarpus hirsutus*.

Speedwell. *Veronica*.

Speira'ntha. (From *speira*, a coil, and *anthos*, a flower; in allusion to the arrangement of the flowers. Nat. ord., *Liliaceæ*; Tribe, *Convallariaceæ*.)

Greenhouse plant, requiring the same culture as ALBUCA.

S. convallarioides. 2. White or greenish. June. China. 1854. Syn., *Albuca Gardensi*. B. M. t. 4842.

Spenne'ra. (Named after M. Spenner, a German botanist. Nat. ord., *Melastomaceæ*; Tribe, *Osbeckiaceæ*. Allied to Pleroma.) This genus is now united with *Aciotis*.

Stove evergreens. Seeds, and cuttings of the young shoots in sand, under a bell-glass, and in heat; sandy peat and fibry loam. Winter temp., 50° to 60°; summer, 60° to 85°.

S. fragilis. 2. White. June. Trinidad. 1822. A synonym of *Aciotis fragilis*.
— *glandulosa*. See *Pleroma glandulosa*.
— *paludosa*. 2. Rose. June. Brazil. 1825. A synonym of *Aciotis paludosa*.
— *pendulifolia*. 2. Rose. March. Guiana. 1826. A synonym of *Aciotis pendulifolia*.

Spe'rgula. Spurrey. (From *spargo*, to scatter; in allusion to the scattering of the seeds. Nat. ord., *Caryophyllaceæ*; Tribe, *Alsineæ*.)

Hardy annual herbs. To raise from seed, sow in May. To establish an edging in place of grass, from plants, plant patches in September about two inches apart. They require to be frequently beaten flat with the back of the spade. It seems too apt to become patchy to be relied

upon for any extensive surface, like a lawn. *S. arvensis* has proved a satisfactory crop, on light sandy soils, for conversion into ensilage.

S. arvensis. 1-2. White. Summer. Britain.
— *pilifera* and its variety *arvensis* are now referred to *Sagina pilifera*.

Spermaco'ce. Button Weed. (From *sperma*, a seed, and *akoke*, a point; the pointed calyx teeth crown the fruit. Nat. ord., *Rubiaceæ*; Tribe, *Spermatococceæ*.)

A large genus of stove, greenhouse and hardy herbs or shrubs, of which but few species have been introduced into cultivation.

S. Bruno'nis. See *Knozia brachycarpa*.
— *hirta*. Jacq. Ic. t. 308. See *Mitracarpum hirtum*.

— *stricta*. 2. White. July. Porto Rico. Syn., *Borreria stricta*.

— *sumatrensis*. A synonym of *Knozia sumatrensis*.

— *verticillata*. 1-2. White. July. West Indies and Mexico. Syns., *Borreria commutata* and *B. verticillata*.

Spermadi'ctyon. (From *sperma*, a seed, and *dictyon*, a net. Nat. ord., *Rubiaceæ*; Tribe, *Pederialaceæ*.) A synonym of **Hamiltonia**.

Stove evergreen shrubs.

S. azureum. B. R. t. 1235. A synonym of *Hamiltonia scabra*.

— *suaveolens*. B. R. t. 348. A synonym of *Hamiltonia suaveolens*.

Spermaxy'rum. (From *sperma*, a seed, and *xuros*, shaven. Nat. ord., *Olaecineæ*.) A synonym of **Olaex**.

S. strictum. A synonym of *Olaex stricta*.

Spha'cele. (A Greek name for some *Salvia*. Nat. ord., *Labiatae*; Tribe, *Satureineæ*. Allied to *Horminium*.)

A handsome free-flowering herbaceous perennials, requiring the same treatment as the more tender species of *SALVIA*, and the temperature of a warm greenhouse.

S. caerulea. Light blue. Summer. 1866. Flor. Mag. t. 281.

— *campanulata*. 2-3. Pale blue. July. Chili. 1795. B. R. t. 1382.

— *Lindleyi*. 3-4. Purplish-violet. July. Chili. 1825. B. M. t. 2993. Syn., *Stachys Salvia*. B. R. t. 1226.

Spha'ralcea. (From *sphaera*, a globe, and *alcea*, the Marsh Mallow; the seedpods, or carpels, are in globular heads. Nat. ord., *Malvaceæ*; Tribe, *Malvaceæ*. Allied to Mallow.)

Annuals, by seed in a hotbed, in April, planted out at the beginning of June; shrubs, by cuttings of young shoots in sandy soil, under a hand-light, in summer; loam and peat. Winter temp., 40° to 48°.

S. abutiloides. A synonym of *Malva abutiloides*.
— *acerifolia*. Rose. N. W. America. 1863. B. M. t. 5404. Half-hardy.

— *angustifolia*. 2. Pink. August. Mexico. 1780. Syn., *Malva angustifolia*. B. M. t. 2544.

— *caroliniana*. See *Modiola caroliniana*.

 — *obtusilo'ba*. 4. Purple. July. Chili. 1827. Syn., *Malva obtusiloba*. B. M. t. 2787.
 — *prostra'ta*. See *Modiola prostrata*.
 — *umbello'ta*. See *Malva umbellata*.

Sphæro'gyne. (From *sphaira*, a globe, and *gyne*, a female; shape of female organ. Nat. ord., *Melastomaceæ*; Tribe, *Miconiææ*.) A synonym of **To-coca**.

Stove shrubs. For cultivation, see CENTRADIENIA.

- S. cinnamo'mea*. Costa Rica. 1866.
 — *ferrugi'nea*. A synonym of *Toococa ferruginea*.
 — *imperia'lis*. A synonym of *Toococa imperialis*.

Sphærolo'bium. (From *sphaira*, a globe, and *lobos*, a pod; the pods are globose. Nat. ord., *Leguminosæ*; Tribe, *Podalyriææ*.)

Greenhouse, evergreen shrubs. Soil, a compost of loam and peat. Propagated by cuttings in sand, under a bell-glass.

- S. acumina'tum*. See *S. medium*.
 — *me'dium*. 2. Red or orange. Summer. Australia. 1803. Syn., *S. acuminatum*.
 — *vimi'neum*. 2. Yellow. Summer. Australia. 1802. B. M. t. 969.

Sphærophy'sa. (From *sphaira*, a globe, and *physa*, a bladder; the pods are globose and bladder-like. Nat. ord., *Leguminosæ*; Tribe, *Galegeææ*.)

Hardy, perennial herb or sub-shrub. Sandy loam, with an occasional application of salt. Seeds.

- S. ca'spica*. See *S. salsula*.
 — *sa'lsula*. 1½. Pale purple. July. Russia and Northern Asia. 1818. Syn., *S. caspica*.

Sphæro'pteris. (From *sphaira*, a globe, and *pteris*, a fern; the involucre are globose. Nat. ord., *Filices*.)

Stove fern. For culture, see FERNS.

- S. barba'ta*. 3. Northern India. Syn., *Pernema cyatheoides*.

Sphæroste'ma. (From *sphaira*, a globe, and *stema*, a stamen; stamens collected into close clusters. Nat. ord., *Magnoliaceæ*; Tribe, *Schizandreaæ*.) A synonym of **Schizandra**.

Stove evergreen climbers. Cuttings of half-ripened shoots in sand, under a bell-glass, and in bottom heat: sandy, fibry peat, fibry loam, with a little charcoal and broken pots, and well drained. Winter temp., 45°; summer, 60° to 80°. A lower temperature even might be tried in winter, if the wood was well ripened.

- S. marmo'ratum*. See *Schizandra marmorata*.
 — *prop'i'ngum*, B. M. t. 4614. See *Schizandra propinqua*.

Sphærosti'gma. (From *sphaira*, a globe, and *stigma*, the female organ. Nat. ord., *Onagraceæ*.) A synonym of **Ænothera**.

Hardy biennials and annuals, by seeds in the open border, in April; *cheiranthifo'lium* by cuttings of young shoots in spring

- S. Chamisso'nis*. 1. Yellow. August. Russia. 1837. Annual. A synonym of *Ænothera dentata*.
 — *cheiranthifo'lium*. See *Ænothera cheiranthifolia*.
 — *hi'rturn*. A synonym of *Ænothera dentata*.
 — *minutifo'lrum*. 1. Yellow. August. Russia. 1837. Annual. A synonym of *Ænothera minutiflora*.

Spha'gnum. This is a genus of pale green-leaved Mosses, becoming white when dry, commonly found on peat-bogs. There are several British species, the commonest of which is *Spha'gnum cymbifo'lrum*. It is an excellent material for packing plants in, being extremely retentive of moisture, and yet contains so much astringency as to check decay. It is also extremely useful for placing on the surface of pots containing plants, which thrive in damp situations, as is the case with certain Orchids.

Sphen'a'ndra. (From *sphen*, a wedge, and *aner*, *andros*, a male or anther; the anthers are wedge-shaped. Nat. ord., *Scrophulariaceæ*; Tribe, *Manuleæ*.)

Greenhouse annual or perennial herb. Loamy soil. Seeds.

- S. visco'sa*. 1. Violet. June. South Africa. 1773. Syn., *Buchnera viscosa*. B. M. t. 217.

Sphenode'sma. (From *sphen*, a wedge, and *desme*, a bundle; referring to the shape of the inflorescence. Nat. ord., *Verbenaceæ*; Tribe, *Symphoremææ*.)

Stove, climbing shrubs. Cuttings in sand, under a bell-glass, in heat.

- S. Jackia'na*. See *S. pentandra*.
 — *penta'ndra*. 6. Purple, white. June. East Indies. 1823. Syn., *S. Jackiana*.

Sphen'o'gyne. (From *sphen*, a wedge, and *gyne*, female organ; the shape of pistil. Nat. ord., *Compositæ*; Tribe, *Arctotideææ*.) See **Ursinia**.

All yellow-flowered, and natives of South Africa. Annuals, by seed, under protection in April, or in the open border in the end of May; shrubs, by cuttings of young shoots in sand, under a bell-glass, in a cool pit, in May; loam and peat, sandy and fibry. Winter temp., 40° to 45°.

- S. abrotanifo'lia*. See *Ursinia abrotanifolia*.

 — *specio'sa*. Kn. and West. t. 77. See *Ursinia speciosa*.

Spheno'toma. (From *sphenoo*, to cleave, and *tome*, a section; limb or border of the flower deeply cut. Nat. ord., *Epacridæ*; Tribe, *Epacreae*.) See **Dracophyllum**.

Greenhouse, white-flowered evergreens, from Australia. Cuttings of young shoots when a couple of inches in length, provided they are getting a little firm at the base, in sand, under a bell-glass, in spring; sandy, fibry peat, with a little charcoal. Winter temp., 38° to 45°; might be tried in a very sheltered rock-work, among peat and broken freestone.

S. capitatum. B. R. t. 1515. See *Dracophyllum capitatum*.

— *gracile*. See *Dracophyllum gracile*.

Sphinctaca'nthus. (Derivation not given. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.)

Greenhouse herb, requiring a light loamy soil. *S. Griffithii*. White, purple. October. South Africa. 1774. Syn., *Justicia orchoides*, B. C. t. 827.

Spice Bush. *Linde'ra Benzoi'n.*

Spider Flower. *Cle'ome.*

Spider Orchis. *O'phrys arani'fera.*

Spiderwort. *Tradescan'tia.*

Spielma'nnia. (Named after J. R. Spielmann, a German botanist. Nat. ord., *Myoporineæ*.) See **Oftia**.

Greenhouse, evergreen shrub.

S. africa'na. B. M. t. 1899. See *Oftia africana*.

Spige'lia. Worm Grass. (Named after A. Spigelius, a botanist of Padua. Nat. ord., *Loganiaceæ*; Tribe, *Euloganiææ*.)

Annuals, by seed under the usual treatment; hardy herbaceous, by seed and division of the roots; loam and peat.

S. anthel'mia. 1½. Red. July. S. America. 1759. Stove annual. B. M. t. 2359.

— *marita'ndica*. 1. Scarlet. July. N. America. 1694. Hardy herbaceous. B. M. t. 80.

Spikenard or Nard. *Nardo'sta'chys.*

Spikenard, Ploughman's. *Ba'ccharis.*

Spila'nthes. (From *spilos*, a spot, and *anthos*, a flower; the species on which the genus was founded has the disk appearing like a brown spot in the centre of the yellow flower. Nat. ord., *Compositæ*; Tribe, *Helianthoidææ*.)

S. crocata. B. M. t. 1627. See *Verbesina crocata*.

— *exaspera'ta*. 2. Yellowish. Venezuela. Jacq. Ic. t. 584.

— *olera'cea*. 1. Yellow. India and S. America. Jacq. H. Vind. t. 135. Sometimes regarded as a variety of *S. acmella*.

Spinach. *Spina'cia olera'cea.*

There are the *Round-leaved*, or *Smooth-*

seeded, and the *Triangular-leaved*, or *Prickly-seeded*. The first being the most succulent, is employed for the spring and summer crops, and the latter for autumn and winter. The *Lettuce-leaved* and the *Flanders* are hardy for a winter crop, and by far the best.

Soil.—For the round-leaved variety, a rich, light, moist loam, in an open situation, is preferable; but for the triangular-leaved, and other winter varieties, a light, moderately fertile, and dry border. The earth should always be well pulverized at the time of digging, and the soil for the summer crops cannot be too rich. Liquid-manure is highly beneficial to them, and when made of blood and the most fertilizing matters, the greater the benefit.

Sow the round-leaved variety at the close of January in a warm situation, to be repeated in larger, but still small breadths, at the commencement and end of February, and to be continued every three weeks until the middle of April, when it must be performed once a week until the close of May, and then once a fortnight till the end of July. In August sow at intervals of three weeks until the early part of September. Sow thinly in drills half an inch deep and a foot apart. The sowing should be in showery weather, otherwise an occasional watering must be given; for if there is a deficiency of moisture during the first grades of vegetation, not half of the seedlings will come up. The triangular-leaved plants must be thinned to four or five inches apart, and the round-leaved to eight. Thin by degrees, separating them at first only an inch or two, as the plants of the several thinnings are fit for use. The thinning ought to commence when they have attained four leaves about an inch in breadth. Regular gathering promotes the health of the plants. The outer leaves only should be gathered at a time, the centre being left uninjured, to produce successional crops. This direction applies chiefly to the winter-standing crops; those of the summer may be cut off close to the root.

To obtain Seed.—A sowing of each variety may be made in February or March, according to the openness of the season; or, of the round-leaved variety, some plants of a regular crop may be allowed to run up in April or May; and of the triangular-leaved, some plants of the winter-standing crops may be transplanted in March. Set them twelve inches apart. Spinach is diœcious, and many ignorant persons, perceiving some of the plants to have no appearance of

bearing seed, advise these to be pulled up; but they are the male-bearing plants, without which the others would be unfruitful. If, however, they are very numerous, some of them may be removed with benefit to those that remain, care being taken that some are left in every part of the bed. When the seed is set the male plants may be entirely removed. When the seed is ripe in July or August, the plants ought to be pulled up, and laid to dry thoroughly on a cloth, previous to its being beaten out and stored.

Spinach, Mountain. *Atriplex hortensis*.

Spinach, New Zealand. *Tetragonia expansa*.

Spinach, Wild. *Chenopodium Bo'nus-Henri'cus*.

Spinacia. Spinach. (From *spina*, a prickle; seeds prickly. Nat. ord., *Chenopodiaceae*; Tribe, *Atriplicae*.)

Hardy, green-flowered annual. See SPINACH. *S. oleracea*. 1½. June. South-east Europe. 1568.
— *glabra*. 1½. June. Round-seeded, or Summer Spinach.
— *spinosa*. 1½. June. Prickly-seeded, or Winter Spinach.

Spindle-Tree. *Eucalyptus*.

Spinovitis. (From *spinus*, spiny, and *vitis*, a vine. Nat. ord., *Ampelideae*.)

A climbing plant, resembling the vine, but having its stem covered with spines. Propagated by seeds.

S. Davidii. Green. North China. Rev. Hort. 1885, p. 55, fig. 10.

Spiræa. (From *speira*, anything wreathed; the flowering branches used in garlands. Nat. ord., *Rosaceae*; Tribe, *Spiræeae*.)

All white-flowered, except where otherwise mentioned. Herbaceous and tuberous, by division of the plant in spring; shrubs, by cuttings, layers, and suckers; good garden-soil.

HARDY TUBEROUS-ROOTED.

 — *Smitthii*. Yellow and green, or brownish and green. Costa Rica. 1868.
 — *Weirii*. Reddish. Columbia. 1870.

Spire Lily. *Galtonia candicans*.

Spirone'ma. (From *spira*, spiral, and *nema*, a filament; stamens spiral. Nat. ord., *Commelinaceae*; Tribe, *Tradescantieae*. Allied to *Tradescantia*.)

Greenhouse herbaceous. Seeds, and division of the roots; sandy, fibry peat and loam. Winter temp., 45° to 55°; summer, 60° to 80°.

S. fragrans. 1. White. May. Mexico. 1839.
B. R. 1840, t. 47.

Spleenwort. *Asplenium*.

Sp'ondias. Hog Plum. (The ancient name of a wild Plum; resemblance of fruit. Nat. ord., *Anacardiaceæ*; Tribe, *Spondiææ*.)

Stove evergreen trees. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat, in May or June; loam and peat. Winter temp., 50° to 55°; summer, 60° to 80°.

S. acuminata. June. Malabar. 1824.

— *axillaris*. See *S. lutea*.

— *borbonica*. 40. Deep purple. Bourbon. 1825.

— *dulcis*. 50. Yellowish-green. June. Society Islands. 1793. Syn., *Poupartia dulcis*. Sweet Otaheite apple.

— *lutea*. 30. Yellowish. Summer. West Indies. 1739. Syns., *S. azillaris*, *S. Mombin*, *S. Myrobalanus* and *S. purpurea*. Golden Apple; Jamaica Plum.

— *mangifera*. 30. White. East Indies. 1820. Syn., *Poupartia mangifera*.

— *Mombin*. See *S. lutea*.

— *myrobalanus*. See *S. lutea*.

— *purpurea* of Miller, not Linnæus, see *S. lutea*.

Sponge Tree. *Acacia farnesiana*.

Spongiole. A term formerly used for the tips of roots, it being supposed that these slightly swollen tips acted in a sponge-like manner in absorbing food for the plant. It is now known that they are organs to protect the growing point of the root and are called root-caps or pileorhizæ, while absorption of food is effected by the root-hairs.

Sporangium or Sporange. The cases in which the spores or ultimate reproductive bodies are inclosed in Cryptogams or flowerless plants. For a description of the sporangia of Ferns, see **Sorus**.

Spore or Sporidium. The bodies by which cryptogamic plants are reproduced. The term is now restricted to such bodies as are produced by sexual agency; nonsexual reproductive organs are variously called *gemmæ*, *conidia*, *gonidia*, etc. Spores are generally minute, but differ much in form and structure.

Sporting is the term whereby gardeners describe any deviation from the usual form or colours of a plant or flower.

Spot. A disease occurring on the leaves of the pelargonium, is a dry gangrene, occasioned by an irregularity in the supply of moisture and vicissitudes of temperature, but especially if one of the extremes is much below the degree of heat most favourable to the healthy

growth of that plant. The reason of this is very obvious. If a pelargonium, or any other plant, be placed in a highly stimulating heat, and abundantly supplied with root moisture, it immediately increases its surface of leaf to elaborate and digest the large amount of sap forwarded from the roots. If this amount of sap is subsequently suddenly reduced, by lowering the temperature and adding water to the soil less freely, the increased surface of leaf is no longer required, and it is a law pervading all the vegetable creation that the moment any one of the parts of a plant is unnecessary to it, immediately that part begins to decay.

Spra'guea. (Named after Isaac Sprague, an American botanical draughtsman. Nat. ord., *Portulacææ*.)

Hardy perennial, adapted for rockwork and edge of flower borders. Cuttings in spring.

S. umbellata. White, purple. July. California. 1859. B. M. t. 5143.

Spread Eagle. *Oncidium carthagineum*.

Spreke'lia. (Named after Dr. Sprekel, a German botanist. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllidææ*.)

This is the name for the old *Amaryllis formosissima*, or Jacobæa Lily, not of Dr. Herbert, but of Heister, a German botanist; and Dr. Herbert had some doubts latterly of its correctness. Stove bulbs. For culture, see HIPPEASTRUM.

S. Cybister, B. M. t. 3872, and var. *brevis*, B. R. 1840, t. 33. See *Hippeastrum Cybister*.

— *formosissima*. †. Crimson. June. Guatemala. 1658. Swt. Fl. Gard. ser. 2, t. 144. Syn., *Amaryllis formosissima*, B. M. t. 47.

— *glauca*. 1. White. April. Bolivia. 1839. Syn., *S. glauca*. B. R. 1841, t. 16.

— *ringens*. Crimson, green. Flowers drooping.

— *glauca*. See *S. formosissima*, var. *glauca*.

Spreng'lia. (Named after C. Sprengel, naturalist. Nat. ord., *Epacridææ*; Tribe, *Epacraææ*. Syn., *Poncelétia*.)

Greenhouse evergreens. Cuttings of short young shoots, a little firm at the base, in sand, under a bell-glass, in spring and early summer. Winter temp., 35° to 45°.

S. Andersoni. See *Andersonia sprengelioides incarnata*. 2. Flesh. May. N. S. Wales. 1793. B. M. t. 1719.

— *Poncelétia*. 1. Scarlet. May. Extra-tropical Australia. 1826. Syn., *Poncelétia sprengelioides*.

Spring Beetles. The *Elatridææ*, a group of insects, one phase of whose life is known as the **Wireworm**, which see.

Spring Bell. *Sisyrinchium grandiflorum*.

Spring Grass. *Anthoxanthum*.

Spring Snowflake. *Leucorum vernum*.

Spruce Fir. *Dacrydium cupressinum*, also some species of *Picea*.

Spruce Gall. See *Adeleges abietis*.

Sprue. A market name for the smallest sprouts of asparagus.

Spurge Flax. *Da'phne Meze'reum*.

Spurge Laurel. *Da'phne laure'ola*.

Spurge Nettle. *Ja'tropha u'rens*.

Spurge Olive. *Cneo'rum trico'ccum* and *Da'phne Meze'reum*.

Spurgeworts. The *Euphorbia'cea*.

Spurless Violet. *Vi'ola heder'a'cea*.

Spurring is cutting the lateral or side-shoots, so as to leave only a few buds in length of them projecting from the main branches.

Spyri'dium. (From *spyris*, a basket; application not apparent. Nat. ord., *Rhamnaceæ*; Tribe, *Rhamnecæ*.)

Tall greenhouse shrub. For cultivation, see POMADERIS, to which it is allied.

S. globulo'sum. West Australia. 1874. Gf. t. 795. Syn., *Pomaderris globulosa*.

Squash. (*Cucu'rbita melope'po*.) See **Cucurbita**.

Squill, Roman. *Hyac'inthus romanus*.

Squill, Scilla.

Squill, Striped. *Puschki'nia scilloides*.

Squinant. *Andro'pogon Schaena'nthus*.

Squirrel-tail Grass. *Ho'rdeum*.

Squirting Cucumber. *Ecba'lium Elate'rium*.

Staa'via. (Named after *M. Staa*, a correspondent of Linnæus. Nat. ord., *Bruniaceæ*.)

Greenhouse, white-flowered evergreens, from South Africa. Cuttings of young shoots in sand, under a bell-glass; sandy, fibry peat. Winter temp., 38° to 45°.

S. cilia'ta. 1½. June. 1812. Syn., *Brunia ciliata*.

— *glutino'sa*. 1½. April. 1793. B. C. t. 852. Syn., *Brunia glutinosa*.

— *radia'ta*. 1. May. 1787. Syn., *Brunia radiata*.

Stachys. Hedge Nettle. (From *stachys*, a spike; their manner of flowering. Nat. ord., *Labiataæ*; Tribe, *Stachydecæ*.)

Herbaceous perennials, by seeds and divisions; shrubs, by cuttings under a hand-light, in sandy soil, in summer. The tender kinds require a cold pit or greenhouse in winter. There are many annuals and biennials, but not worth culture.

HARDY EVERGREENS.

- S. fruticulo'sa*. 1. Purple. July. Caucasus. 1818.
— *palcesi'na*. 1. Purple. July. Syria. 1820.
— *stenophylla*. 1. Yellow. July. Spain. 1823.
Syn., *Sideritis linearifolia*.

Stachy'rus. (From *stachys*, a spike, and *euros*, broad. Nat. ord., *Ternstroemiaceæ*; Tribe, *Saraujæcæ*.)

Half-hardy evergreen shrub. Cuttings of the points of shoots in sand, under a bell-glass, in April; fibry, sandy loam and a little peat. Winter temp., 35° to 45°.

- S. præ'cox*. Pink. April. Japan. Sieb. Fl. Jap. t. 18.

Stackhou'sia. (Named after Mr. Stackhouse, a British botanist. Nat. ord., *Stackhousiæcæ*.)

Australian plants. Perennial, by division of the plant in spring; shrubs, by cuttings in sand, under a bell-glass, in summer. Winter temp. for latter, 35° to 45°.

- S. linariæfo'lia*. 2. 1823. Evergreen.
 — *mono'gyna*. 1. Pink. April. 1835. B. R. t. 1917. Hardy herbaceous.
 — *spathula'ta*. White. April. 1825. Evergreen.

Stadma'nnia. (Named after M. Stadmann, a botanical traveller. Nat. ord., *Sapindacææ*; Tribe, *Sapindæcæ*.)

Stove evergreen tree. Allied to *NEPHELIUM*, to which refer for cultivation.

- S. ama'bilis*. Zanzibar. 1873.

Stæheli'na. (Named after B. Stæhelin, a Swiss botanist. Nat. ord., *Compositææ*; Tribe, *Cynaroideæ*. Allied to *Arctium*.)

Half-hardy, purple-flowered, deciduous shrubs. Cuttings in sandy soil, under a hand-light, in

summer; sandy, fibry loam and leaf-mould; require the protection of a cold pit in winter.

- S. arbore'scens*. 4. August. Candia. 1739. Sibth. Fl. Gr. t. 845.
 — *chamæpe'ce*. 2. July. Candia. 1640. Sibth. Fl. Gr. t. 847.
 — *du'bia*. 3. June. South Europe. 1640.
 — *gnaphal'odes*. A synonym of *Helipterum gnaphaloides*.

Staff-Tree. *Cela'strus*.

Stag Beetle. *Luca'nus ce'rurus*.

Standard. A tree unsupported by a wall or trellis.

Full Standards are such trees as are trained with tall, straight stems, six or seven feet high, clear of branches, and are then suffered to branch out.

Half Standards are trees trained with short stems only two or three feet high, then suffered to branch out at that height to form heads; having low heads the fruit is more easily gathered. *Concave* dwarfs have the middle hollow, and the branches all round in a cup form. *Horizontal* dwarfs have the branches extended all round in a flat or horizontal position, but the concave dwarf is to be preferred.

Stange'ria. (Named after Dr. Stanger, of Natal. Nat. ord., *Cycadacææ*; Tribe, *Encephalartecæ*.)

Stove plant. For cultivation, see *ZAMIA*, to which it is allied. It has the leaves of a cycad, and the forked veins of a fern.

- S. parado'aa*. 2. Natal. 1851. B. M. t. 5121.
 — *Ka'tzeri*. S. Africa. 1875. Gf. t. 798. Syn., *S. Katzeri*.
 — *schizodon*. Natal. 1872. Syn., *S. schizodon*.

Stanho'pea. (Named after Earl Stanhope, 1781-1855. Nat. ord., *Orchidææ*; Tribe, *Vandææ*—*Stanhopeicæ*.)

Stove orchids, grown in pots. See *ORCHIDS*.
S. auro'ntia. Orange. June. La Guayra. 1840.

- *au'rea*. See *S. Wardii*, var. *au'rea*.
 — *Bark'e'ri*. Yellow, brown. July. Mexico.

- *xytriphora*. Straw, purple. Peru. 1868.

Stanhopeastrum. (From *Stanhopea*, and *astron*, a star. Nat. ord., *Orchidææ*; Tribe, *Vandææ*—*Stanhopeææ*.) See **Stanhopea**.

S. ecornutum. Rhcb. Xen. i. t. 43. See *Stanhopea ecornuta*.

Stanleya. (Named after the Earl of Derby. Nat. ord., *Cruciferae*; Tribe, *Sisymbriææ*.)

Hardy herbaceous perennial. Seeds and division of the plant in spring; sandy loam and vegetable mould.

S. pinnatifida. 1. Yellow. June. Louisiana. 1816.

Stapelia. (Named after J. B. Stapel, a Dutch botanist. Nat. ord., *Asclepiadaceæ*; Tribe, *Stapelieæ*.)

Greenhouse evergreens, from South Africa. Cuttings of shoots in spring, well-dried at the base before inserting them in sandy soil; sandy loam, brick-rubbish, and broken bricks, with top-dressings of rotten cow-dung when growing freely, or manure waterings. Winter temp., 40° to 50° and dry; summer, 60° to 80°, and moisture, but with judgment at all times.

Staphyle'a. Bladder-Nut. (From *staphyle*, a bunch; flowers in clusters. Nat. ord., *Sapindaceæ*; Tribe, *Staphyleæ*.)

Hardy, white-flowered, deciduous shrubs. Seeds sown when ripe, remaining a year or more in the soil; cuttings in September; layers and suckers; any light soil. *occidentalis* requires a hothouse, but it scarcely deserves one; *pinnata* is singular for its large bladder-capsules.

- S. Bolanderi*. California. 1883.

Star Apple. *Chrysophyllum*.

Star-fish Flower. *Stapelia Asterias*.

Star Flower. *Aster*, *Sternbergia*, *Tricentris* and *Triteleia*.

Star Grass. *Aletris farinosa*.

Star Head. *Scabiosa*.

Star Hyacinth. *Scilla amœna*.

Star of Bethlehem. *Ornithogalum umbellatum*.

Star, Sea. *Aster tripolium*.

Star Thistle. *Centaurea calcitrapa*.

Starwort. *Aster* and *Stellaria*.

Starting. A term used to designate hastening the commencement of growth, either in seed or plant, by submitting it to artificial heat.

Sta'tice. Sea Lavender. (From *stazio*, to stop; the powerful medical astringency of some of the species. Nat. ord., *Plumbaginæ*; Tribe, *Staticeæ*.)

Hardy perennials, by division and seeds, and tender species by similar means, and also by cuttings; those requiring a cold pit and greenhouse flourish best in sandy, fibry loam and a little peat, also good and fibry.

Stations for Fruit-trees. Unless the soil is good, this is the best mode of planting; and it often renders draining unnecessary. If the soil be too wet, the hole need only be half the prescribed depth; the other half may rise above the ordinary ground level. If too dry, there is no occasion to elevate the surface, only care must be taken not to place the collar of the tree too deep, which is a serious fault under all circumstances. Let the stations extend three feet on each side of the position for the tree, thus producing an excavation of six feet square. Two feet in depth is amply sufficient for any fruit-tree, especially for a dwarfing plan. The soil should then be thrown entirely out, and four or five inches more must be allowed for some impervious material, which we will presently describe. In throwing out the soil, care must be taken to place it in samples, or both labour and material will be wasted. It very frequently happens that three distinct samples of soil or subsoil will come to hand during the operation. Of course all clayey, or sour, and badly-coloured subsoil must be rejected, and its amount will be supplied by the new material to be introduced; and if this is scarce, any ordinary surface-soil may be in part substituted. In filling the materials back again, the best

of the original surface-soil must be kept downwards, mixing it thoroughly with the new soil; the inferior or second-rate soil may be kept to dress the surface with. As to character of soil to be introduced, that depends partly upon the soil already existing in the garden, as well as on the kind of fruit-tree about to be planted. If the soil is naturally sandy and dry, a very stiff or clayey loam should be selected; if naturally clayey, any fresh, mellow, sandy loam, or even the paring of roadsides, commons, or lanes, will prove excellent material. The furrowings of old leys from what is considered good wheat soil, is, however, of all other soils the best adapted for general fruit culture. Whatever materials are used, let it be remembered that the more of turfy matter that can be introduced, the longer will the compost endure. Any sort of turf, even from hungry situations, is most relished by fruit-trees. If, nevertheless, no turf can be obtained, and the soil is loose and poor, it is well to introduce any vegetable refuse of a dry character, such as decayed bean or pea haulm, ordinary straw, old thatch, or, indeed, anything of a decaying vegetable character which is strong in fibre and durable. If any manure is thought necessary, it should be fresh from the stable or cow-shed, as such will endure longer in the soil; merely using one barrowful of mellow and rather rich soil to plant the tree in. As before observed, the most inferior portion of the soil may be reserved to dress the surface of the station with after the tree is planted; here it will do no harm, and will be in a position for improvement. We now come to the hard materials for the bottom of the hole; four or five inches in depth, as before stated. It matters not what this is composed of: broken stones from quarries, brickbats, chalk, cinders, or clinkers, etc., are all eligible. These being rammed hard, throw a coating of fine-riddled cinders, or very fine gravel over the whole: this secures drainage, and prevents the roots entering to any injurious extent.

Staunto'nia. (Named after *George Staunton*, a traveller in China. Nat. ord., *Berberidaceæ*; Tribe, *Lardizabaleæ*. Allied to *Holbellia*.)

Hardy evergreen climber, producing deliciously scented flowers. Cuttings of young, half-ripened shoots in sandy soil. Sandy loam. In autumn the long trailing shoots should be cut back, leaving only those from which flowers are desired.

S. hexaphylla. White. April. Japan. 1876. Sieh. Fl. Jap. t. 176.

— *latifolia*. A synonym of *Holbellia latifolia*.

Stauracanthus. (From *stauros*, a cross, and *akantha*, a spine; two side-spines at the base of the principal spine give it the resemblance of a cross. Nat. ord., *Leguminosæ*; Tribe, *Genistecæ*.) See **Ulex**.

Hardy evergreen. Seeds, and cuttings of young shoots under a hand-light, in summer, in sandy soil.

S. aphyllus. See *Ulex genistoides*.

Staurationthera. (From *stauros*, a cross, and *anthera*, an anther; the anthers cohere in the form of a cross. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

For cultivation, see RHYNCOGLOSSUM.

S. grandifolia. Lilac, orange. Moulmein. 1863. B. M. t. 5409. Greenhouse.

Stauropsis. (From *stauros*, a cross, and *opsis*, like; in allusion to the shape of the flower. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Sarcantheeæ*.)

Stove epiphytal orchids, requiring the same culture as VANDA, which see.

S. Batemanni. Yellow, crimson, purple. Summer. Philippine Islands. Syns., *Fieldia lissochiloides*, *Vanda Batemanni*, B. R. 1846, t. 59, and *V. lissochiloides*.

— *fasciata*. White, yellowish, purple. Eastern Tropical Asia. 1872. Syn., *Trichoglottis fasciata*.

— *gigantea*. Deep yellow, blotched with cinnamon; lip white. Spring. Burmah. 1858. Syn., *Vanda gigantea*, B. M. t. 5189.

Staurostigma. (From *stauros*, a cross, and *stigma*, a stigma; referring to the cross or star-shaped stigmas. Nat. ord., *Aroideæ*; Tribe, *Dieffenbachieæ*. Syn., *Asterostigma*.)

Stove plants, with tuberous rootstock. They require a season of rest, during which they should be watered sparingly and not allowed to get perfectly dry. Sandy loam and peat, well drained. Summer temp., 75° to 85°; winter, 60° to 70°.

S. colubrinum. Livid green, purple-brown, red. Rio Janeiro. 1860.

— *concinnum*. 1½. Whitish, red. Brazil. 1860. Syn., *Caladium luridum*, B. C. t. 1590.

— *Riedelia*. 2. Dull green, cream-colour. Bahia. 1860.

— *zebrina*. Rio Negro. 1865.

Staves-Acre. *Delphinium staphisagria*.

Steeping. (See **Germination**.) It is a very unfounded idea, that by steeping seeds in certain solutions the vigour and fecundity of the plants to which they give birth might be promoted. A certain degree of heat, oxygen gas, and water are all the requisites for germination, and until this process has commenced, no liquid but water at common

temperatures is required. At first the plants are absolutely dependent for their very existence upon the food contained in or around the seed-leaves, and if these are removed the plant either makes no further advance or altogether perishes. To hasten the germination of peas, beans, etc., it is a good plan to soak them in water for twelve hours previously to sowing; and old seeds of all kinds have had their germinating powers aroused by putting them into water heated to 200° Fahr., and allowing them to remain in it until cold, but the temperature of the water must be governed by the nature of the seed.

Stelis. (A Greek name for some parasitical plant. Nat. ord., *Orchideæ*; Tribe, *Epidendreeæ-Pleurothalleæ*.)

Stove epiphytes. For cultivation, see PLEUROTHALLIS, to which they are allied. Many species are mentioned in Loudon's "Hortus Britannicus" without descriptions, and not having been described in any other work, cannot be identified.

S. atropurpurea. B. M. t. 3975. See *S. citiaris*. — *Bruchmulleri*. ½. Dark purple. December. Andes. 1879. B. M. t. 6521.

Stellaria. Stitchwort. (From *stella*,

a star. Nat. ord., *Caryophyllaceæ*;

Tribe, *Aisneæ*.)

A genus of weedy herbs, except *Stellaria holostea*, which is one of the prettiest flower-garden plants for May in the British Flora. Increased by division of the roots in spring or autumn, when it may be planted out to flower, and may be removed in June when the flowers are over. *S. graminæa*, var. *auræa*, is a variety of garden origin, sometimes employed in carpet bedding.

Stelle'ra. (After *G. W. Steller*, 1709-

1746, a Russian botanical collector. Nat. ord., *Thymelæaceæ*.)

Hardy, perennial herbs or shrubs. Ordinary garden-soil. Divisions.

S. Alberti. Gfl. t. 1262. See *Wikstroemia Alberti*.

— *altaica*. 1. White. July. Altai. 1824.

— *Chamoëa'sme*. 1. White. June. Siberia. 1817.

— *Passeri'na*. Jacq. Ic. t. 68. See *Thymelæa arvensis*.

Stemma'tium. (From *stemmation*, a small crown; in reference to the corona. Nat. ord., *Liliaceæ*; Tribe, *Alliææ*.) See **Tristagma**.

A pretty and interesting greenhouse bulb, somewhat resembling a narcissus. Offsets and seeds. Rich sandy loam; not too much water. Summer temp., 60° to 80°; winter, 50° to 60°. *S. narcissoides*. See *Tristagma narcissoides*.

Stemo'dia. (From *stemon*, a stamen, and *dis*, double; the cells of the anthers are separated. Nat. ord., *Scrophulariææ*; Tribe, *Gratiolææ*.)

Half-hardy herbs. Rich, moist soil. Division of roots.

S. chilensis. 1. Blue. September. Chili. 1829. B. R. t. 1470.
— *durantifolia*. Bluish-purple. Tropical America. 1890.
— *lobeloides*. 1. Deep blue. August. Brazil. 1830. Syn., *Gratiola tetragona*, B. M. t. 3134.

Ste'mona. (From *stemon*, a stamen; the stamens are foliaceous. Nat. ord., *Roxburghiaceæ*.)

Stove climber. Turfy loam. Reproduced by suckers.

S. gloriosoides. 6. Green. July. East Indies. 1803. Syn., *Roxburghia gloriosa*, B. M. t. 1500, and *R. viridiflora*.

Stemonaca'nthus. (From *stemon*, a stamen, and *akantha*, a spine. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*.) See **Ruellia**.

S. macrophyllus. See *Ruellia macrophylla*.
— *Pearcei*. See *Ruellia Pearcei*.

Stena'ctis. (From *stenos*, narrow, and *aktin*, a sunbeam; the rays of the expanded blossoms. Nat. ord., *Compositææ*; Tribe, *Asteroidææ*.) Now united with **Erigeron**.

Hardy herbaceous. Seeds, which, if sown in a slight hotbed in March, will produce plants to bloom the same season; division of the root in spring.

S. heterophylla. 1. White. July. N. Amer. 1840.
— *inuloides*. 1. Red. August. Nepaul.
— *speciosa*. 2. Purple. July. California. 1831. B. R. t. 1577. A synonym of *Erigeron speciosum*.
— *strigosus*. 1. White. July. N. America. 1816.

Stena'ndrium. (From *stenos*, narrow, and *aner*, *andros*, male; referring to the stamens. Nat. ord., *Acanthaceææ*; Tribe, *Justicieææ*.)

Dwarf, stove plant with variegated leaves. *S. igneum*. See *Chamæranthemum igneum*.
— *Lindeni*. Yellow. Leaves dark green, paler towards the edges; veins yellow. Peru. 1890. Ill. Hort. xxxviii. t. 136.

Stena'nthera. (From *stenos*, narrow, and *anthera*, an anther; the filaments broader than the anthers, which are narrower in proportion. Nat. ord., *Epacridaceææ*.) See **Astroloma**.

Greenhouse Australian evergreens. Cuttings of young, short shoots, a little firm at their base, in sand, under a bell-glass, and placed in a cold frame in May; sandy, fibry peat, with enough of charcoal and broken pots to keep the soil open. Winter temp., 40° to 45°.

S. ciliata. A synonym of *Astroloma longiflorum*.
— *pinifolia*. B. C. t. 228. A synonym of *Astroloma pinifolia*.

Stena'nthium. (From *stenos*, narrow, and *anthos*, a flower; the perianth segments arenarrow. Nat. ord., *Liliaceææ*; Tribe, *Veratreeææ*.)

Greenhouse, or hardy bulbs. Compost of sandy loam and peat. Divisions.

S. angustifolium. 2-3. Greenish-white. June. North America. Hardy.
— *gramineum*. A variety with narrower leaves and fewer flowers. Syn., *Helonias graminea*, B. M. t. 1599, and *Xerophyllum gramineum*.
— *frigidum*. 2-3. Purplish. June. North America. 1846. Fl. Ser. t. 468. Hardy.
— *occidentale*. Dark purple. North-west America. 1881. Gfl. f. 1035, fig. 3.

Stenia. (From *stenos*, narrow; the pollen masses. Nat. ord., *Orchideææ*; Tribe, *Vandeeæ-Maxillarieææ*. Allied to **Maxillaria**.)

Stove orchids, grown on blocks. See **ORCHIDS**.

S. fimbriata. See *Chondrorhyncha fimbriata*.
— *gutta*. Straw, purple. July. Peru. 1830.
— *paillida*. $\frac{1}{2}$. Yellow. August. Demerara. 1837. B. R. 1838, t. 20.

Stenocarpus. (From *stenos*, narrow, and *karpus*, fruit; the fruit being long and thin. Nat. ord., *Proteaceææ*. Syn., *Agrostus*.)

Stove or warm greenhouse trees. For cultivation, see **LOMATIA**.

S. Cunninghamii. See *S. sinuatus*.
— *Forsteri*. White. New Caledonia. 1851. Paxt. Fl. Gard. ii. p. 166.
— *salignus*. 5. Greenish. June. Australia. 1719. B. R. t. 441. Beef Wood.
— *sinuatus*. 100. Scarlet. August. Moreton Bay. 1830. Syn., *S. Cunninghamii*, B. M. t. 4263.

Stenochilus. (From *stenos*, narrow, and *cheilos*, a lip; the narrow lip of the flower. Nat. ord., *Myoporineææ*.) Now united with **Eremophila**, under the specific names annexed.

Greenhouse evergreens, from Australia. Cuttings of young shoots in sand, under a bell-glass, in April or May; sandy loam and a little fibry peat. Winter temp., 40° to 45°.

S. elegans. A synonym of *Lamourouzia multifida*.
— *glaber*. 2. Red. 1803. B. M. t. 1942. EREMOPHILA BROWNII.
— *longifolius*. 4. Scarlet. April. 1825. EREMOPHILA LONGIFOLIA.

 — *triquetra*. July. E. Ind.

Stenoco'ryne. (From *stenos*, narrow, and *koryne*, a club. Nat. ord., *Orchidæ*; Tribe, *Vandæ-Maxillariæ*.) See **Bifrenaria**.

Stove orchid, grown in a basket. See ORCHIDS.

S. longicornis. A synonym of *Bifrenaria longicornis*.

Stenoga'stra, sometimes spelt **Stenogaster**. (From *stenos*, narrow, and *gaster*, belly; some of the species have a swelling on the corolla-tube. Nat. ord., *Gesneraceæ*.) See **Sinningia**.

S. concinna. See *Sinningia concinnum*.

Stenoglot'tis. (From *stenos*, narrow, and *glotta*, a tongue; in allusion to the narrow lip. Nat. ord., *Orchidæ*; Tribe, *Ophrydæ-Habenariæ*. Allied to *Habenaria*.)

Greenhouse terrestrial orchids. Divisions of the roots. Loam and rotten leaves, mixed with bits of decayed wood and charcoal. Water plentifully when growing. The temperature of an intermediate house suits them best.

- S. fimbriata*. Rose-pink, purple. S. Africa. 1871. B. M. t. 5872.
 — *longifolia*. 1½. Deep mauve. Natal. B. M. t. 7186.

Stenome'sson. (From *stenos*, narrow, and *messon*, the middle; the flowers contracted in the middle. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllæ*. Syns., *Carpodetes* and *Coburgia*.)

Pretty frame or half-hardy bulbs, requiring complete rest in winter; "sandy soil, shade, and plenty of moisture in summer." They flower before the leaves rise, and are easily increased from offset-bulbs in spring; sandy loam and fibry peat.

- S. aurantiacum*. Orange. May. Quito. 1843. Syns., *S. Hartwegii*, B. R. 1844, t. 42, and *Chrysiophiala aurantiaca*.

Stenorhynchus. (From *stenos*, narrow, and *rhynchus*, a beak; shape of the column. Nat. ord., *Orchidæ*; Tribe, *Neottieæ-Spirantheæ*.) See **Spiranthes**.

Stove orchids, grown in pots. See ORCHIDS.

- S. aphyllus*. A synonym of *Neottia aphylla*.
 — *cinnabarinus*. B. R. 1847, t. 65. See *Spiranthes cinnabarinus*.
 — *speciosus*. Garden, June 14, 1884. See *Spiranthes colorata*.
 — *Ortgiesii*. See *Spiranthes colorata*, var. *Ortgiesii*.

Stenose'mia. (From *stenosemos*, a narrow edge; referring to the fertile fronds. Nat. ord., *Filices-Polypodiaceæ*.) Now united with **Acrostichum**.

Stove fern. See FERNS.

S. aurita. Java.

Stenosperma'tion. (From *stenos*, narrow, and *spermatum*, a diminutive of *sperma*, a seed; on account of the slender seeds. Nat. ord., *Aroidæ*; Tribe, *Orontieæ*.)

Stove evergreen herbaceous perennial. For cultivation, see SPATHIPHYLLUM, to which it is allied.

- S. Wallisii*. 1. Spathe and spadix white. Columbia, B. M. t. 6334. Syns., *S. pompananense* and *Spathiphyllum Wallisii*.

Steno'storum. (From *stenos*, narrow, and *stoma*, a mouth; referring to the flower. Nat. ord., *Rubiaceæ*; Tribe, *Guettardeæ*. Allied to *Guettarda*.)

Stove, white-flowered, West Indian, evergreen shrubs. Cuttings of half-ripened shoots in sand, under a glass, in a sweet bottom-heat; peat and loam. Winter temp., 50° to 55°; summer, 60° to 80°.

- S. lucidum*. May. 1818. Syn., *Guettarda lucida*.
 — *tomentosum*. May. 1822. Syn., *Guettarda tomentosa*.

Stenota'phrum. (From *stenos*, narrow, and *taphros*, a trench; in reference to the cavities in the rachis in which the spikelets are seated. Nat. ord., *Gramineæ*; Tribe, *Panicææ*.)

A curious stove perennial grass. Seeds; divisions. Light loam. Summer temp., 60° to 80°; winter, 55° to 60°.

S. americana. 3. Green. Tropical America, Africa, and Australia. Syn., *S. glabrum*.

— *variegatum*. Leaves white-striped. New S. Wales. 1874. Syn., *Stephanophorum glabrum*, var. *variegatum*.

— *glabrum*. See *S. americana*.

Stephana'ndra. (From *stephanos*, a crown, and *aner*, a man; in allusion to the disposition of the stamens. Nat. ord., *Rosacææ*; Tribe, *Spiræææ*. Allied to *Spiræa*.)

Hardy deciduous shrub. Seeds, cuttings, layers, and suckers. Good garden-soil.

S. flexuosa. White. July. Japan. 1880. Syn., *S. incisa*.

Stepha'nia. (In honour of Professor *Stephani*. Nat. ord., *Menispermæææ*; Tribe, *Cissampelidæææ*.)

Greenhouse climbers. For cultivation, see MORISONIA.

S. hermannifolia. June. India.

— *rotunda*. Orange. Himalaya. 1866.

Stephanoco'ma. (From *stephanos*, a crown, and *kome*, hair; referring to the pappus. Nat. ord., *Compositæææ*; Tribe, *Arctotidæææ*.)

Greenhouse herb. For culture, see STOBÆA.

S. cardioides. 2½. Yellow. Autumn. South Africa. 1864. Syn., *Stobæa decurrens* and *S. sphaerocephala*. B. M. t. 5715.

Stephanoli'rion. (From *stephanos*, a crown, and *lirion*, a lily. Nat. ord., *Liliacæææ*; Tribe, *Alliæææ*.) See *Tristagma*.

S. narcissoides. See *Tristagma narcissoides*.

Stephano'phorum. (From *stephanos*, a crown, and *phoreo*, to bear. Nat. ord., *Gramineæææ*; Tribe, *Panicæææ*.) See *Stenotaphrum*.

S. glabrum variegatum. See *Stenotaphrum americanum*, var. *variegatum*.

Stephanophy'sum. (From *stephanos*, a crown, and *physa*, a bladder. Nat. ord., *Acanthacæææ*; Tribe, *Ruelliaæææ*.) See *Ruellia*.

S. Baiki'ei. B. M. t. 5111. See *Ruellia Baikiæ*.

Stephano'tis. (From *stephanos*, a crown, and *ous*, *otos*, an ear; the ear-like processes on the crown of the stamens. Nat. ord., *Asclepiadacæææ*; Tribe, *Marsdeniæææ*.)

Stove, white-flowered, evergreen twiners. Cuttings of the points of shoots, but best by small, stiff side-shoots, in sand, under a bell-glass, and plunged in bottom-heat; fibry loam and fibry peat, with a little silver sand and dried leaf-mould. Winter temp., 45° to 55°, and rather dry; summer, 60° to 85°, and plenty of moisture

when growing. Would answer, probably, in a warm conservatory when once it reached the top of the roof. See G. C. 1881, xvi., pp. 342 and 379.

S. floribunda. 20. May. Madagascar. 1839. B. M. t. 4058.

— *Thouarsii*. May. E. Ind. 1842.

Stercu'lia. (Named after *Stercus*, a heathen god. Nat. ord., *Sterculiacæææ*; Tribe, *Sterculiaæææ*.)

Stove, or greenhouse evergreens. Cuttings of ripe shoots in sand, under a bell-glass, in moist bottom-heat; fibry loam and peat. Winter temp., 45° to 58°; summer, 60° to 80°. *Tragacantha* produces the gum of that name. *Platanifolia* stood for years in the open air at Chelsea, and it is likely that many of the East Indian and Australian species would thrive with greenhouse treatment.

S. Bala'nghas. B. R. t. 185. See *S. nobilis*.

— *Bidwi'llii*. Red. September. N. E. Australia. 1851. Syn., *Brachychiton Bidwillii*. B. M. t. 5133. Greenhouse.

— *tragacantha*. 40. Red, brown. May. Sierra Leone. 1793. B. R. t. 1853.

Sterile. See *Barren*.

Steriph'o'ma. (From *steriphoma*, a foundation; the fruit-stalk being large. Nat. ord., *Capparidacæææ*.)

Stove shrub. Cuttings under a bell-glass in heat.

S. paradozum. Yellow, orange. July. Venezuela. 1797. Fl. Ser. tt. 564-5. Syn., *S. cleomoides*.

Sternbe'rgia. (Named after *Count Sternberg*, a German botanist. Nat. ord., *Amaryllo'idææææ*; Tribe, *Amaryllo'idææææ*.)

Hardy autumnal-flowering bulbs, with one yellow flower on a stalk, open before the leaves rise; offsets; good, sandy loam and leaf-mould.

S. Clusia'na. 3. Constantinople.

— *colchiciflora*. 3. Hungary. 1816. B. R. t. 2008. Syn., *Amaryllo'idææææ*, Sibth. Fl. Gr. t. 311, and *A. colchicifolia*.

— *gra'ca*. Mountains of Greece.

Steudnera. (Named after *Dr. Steudner*, of Gorlitz, a German botanist. Nat. ord., *Aroideæ*; Tribe, *Dieffenbachieæ*. Allied to *Colocasia*.)

Stove herbaceous perennials. Seeds, suckers, or cuttings or divisions of the rootstock. Rich sandy loam, leaf-mould, and bits of broken charcoal, well mixed and well drained. Moist atmosphere. They require a period of rest. Summer temp., 65° to 85°; winter, 60° to 65°.

S. colocasiæfolia. 1. Spathe purple-brown; spadix whitish. India. 1869. B. M. t. 6762.

— *discolor*. 1. Spathe yellow and purple. India. 1874. Syns., *S. colocasiæfolia* of B. M. t. 6076, and *S. colocasiæfolia*, var. *discolor*.

Stevensonia. (After *Stevenson*, once Governor of the Mauritius. Nat. ord., *Palmeæ*; Tribe, *Areceæ*. Syn., *Phœnicophorum*.)

Stove palm, requiring an atmosphere almost saturated with moisture. Fibrous peat, mixed with sand and pieces of charcoal. Imported seeds.

S. grandifolia. 40. Yellow. Seychelles. 1865. B. M. t. 7277. Syns., *Areca seychellarum*, *Astrocaryum Borsigianum* and *aureo-pictum* and *Phœnicophorum seychellarum*, III. Hort. t. 433.

— *viridifolia*. See *Verschaffeltia splendida*.

Stevia. (Named after *P. J. Esteve*, a Spanish botanist. Nat. ord., *Compositæ*; Tribe, *Eupatoriaceæ*.)

Greenhouse herbaceous perennials, from Mexico, where not otherwise mentioned. They all bloom in August. Seeds and division in spring; sandy, loamy soil. The protection of a cold pit in winter.

S. adenophora. 2. White. Chili. 1822.

— *angustifolia*. 1½. Pink. 1823.

- *sphæroc'e'phala*. B. M. t. 5715. See *Stephanocoma carduoides*.

Stocks are young trees or shrubs raised from seed, suckers, layers, and cuttings, for the reception of buds or grafts from other trees or shrubs of a superior kind.

The old gardener's maxim, "the graft overruleth the stock quite," is consonant with truth, though it is to be taken with some reservation. The graft prevails, and retains its qualities; yet the stock has the power of influencing its productiveness, as well as the quality of the fruit. Thus, a tree having an expansive foliage and robust growth, indicative of large sap vessels and vigorous circulation, should never be grafted upon a stock oppositely characterized, for the supply of sap will not be sufficient.

The habit of the stock, also, is of much more importance than is usually considered. If it grows more rapidly, or has larger sap vessels than the scion or bud, an enlargement occurs below these; but if they grow more rapidly than the stock, an enlargement takes place just above the point of union. In either case, the tree is usually rendered temporarily more prolific; but in the case where the stock grows most slowly, the productiveness is often of very short duration, the supply of sap annually becoming less and less sufficient to sustain the enlarged production

of blossom and leaves. This very frequently occurs to the freer-growing cherries when inserted upon the wild species, and still more frequently to the peach and apricot upon stocks of the slow-growing plums. It is highly important, therefore, to employ stocks, the growth of which is as nearly similar as may be to the parent of the buds or scion.

The earlier vegetation of the stock than of the bud or graft is also important; for, if the latter is earliest in development, it is apt to be exhausted and die before the flow of sap has enabled granulation and union between the faces of the wounds at the junction to occur.

Stocks for general use may be used for grafting or budding, when from the size of a good goose-quill to half an inch, or not more than an inch in the part where the graft or bud is to be inserted. Stocks of two or three inches or more in diameter, either the stems or branches, are also occasionally grafted or budded with success, but are not proper for general practice. *Crab Stocks* are all such as are raised from seeds, etc., of any wild ungrafted trees, particularly if of the fruit-tree kind, such as the wild crab apple of the woods and hedges, wild pears, plums, wild cherry, and such other trees as have not been grafted or budded. *Free Stocks* are such as are raised from the seed, layers, etc., of any of the cultivated varieties of fruit-trees and others. *Paradise* or *Doucin* stocks are raised from layers or suckers from a dwarf variety of apple, the roots of which are produced nearer to the surface than those from crab stocks. The *French Paradise* stock is distinguished from all others by its very dwarf growth, its clear chestnut-coloured shoots, and small fibrous roots, which spread near the surface. The *English Paradise* may be either referred to as the *Doucin* of the French or the *Dutch Paradise*; for, in English nurseries, trees propagated on either are said to be on *paradise* stocks. Of these two the *Doucin* has the darkest shoots. Their effects on the growth of the trees worked upon them are similar, being intermediate between the very dwarf habit induced by the *French Paradise*, and the luxuriant growth induced by the crab or free stocks. See **Grafting** and **Budding**.

Stœ'be. (From *stibas*, a bed of leaves; those of *S. æthiopia* so used. Nat. ord., *Compositæ*; Tribe, *Inuloidæ*.)

Greenhouse evergreens, from South Africa. Cuttings of young shoots in sand, under a bell-glass, in May; fibry, sandy loam and peat. Winter temp., 40° to 45°.

S. aethiopica. 2. August. 1759.

— *cine'ra*. 2. August. 1784.

— *ericoi'des*. 2. August. 1816.

— *reflexa*. 2. August. 1816.

Stoke'sia. (Named after *Dr. Stokes*, an English botanist. Nat. ord., *Compositae*; Tribe, *Vernoniaceae*.)

Half-hardy evergreen. Seeds, or division of the plant in spring; sandy loam and a little leaf-mould; requires a little protection in winter.

S. cya'nea. 2. Blue. August. Carolina. 1766. B. M. t. 4966.

Stoncrop. *Se'dum*.

Stone Pine. *Pinus pi'nea*.

Stopping is pinching or nipping off the extremity of a branch, to prevent its further extension in length. It is frequently done, either to promote its robustness or the production of lateral shoots.

Storax. *Styrax*.

Stork's Bill. *Pelargo'nium*.

Stoves are glazed structures, differing from greenhouses chiefly in requiring a higher temperature to be sustained within them for growing plants from tropical climates. Nearly all that is stated relative to the greenhouse, hot-bed, and pit, under the articles **Melon** and **Rendle's Tank System**, is applicable to the stove. The best form of house is that generally known as *span-roofed*. Light, being highly essential to all tropical, ornamental foliaged and flowering plants, is best obtained by using this form of house. The use of rhomboid panes of glass (as shown in the annexed figure) for conducting condensed vapour to one corner, and thence down the sash-bars, is now entirely abandoned.

Flues are rapidly giving place to hot-water or steam-pipes in the heating of tropical houses. The more recent systems are not only safer, but do their work better, with greater regularity, and, as a rule, require less attention than the older ones. The old troughs (as shown in the annexed figure), so popular in the days of flues, have given place to tanks cast on the pipes, whereby the air may be kept at a uniformly moist temperature.

To ascertain the surface of pipe required to warm any given quantity of

air, multiply the cubic feet of air to be heated per minute by the difference between the temperature the house is to be kept at, and that of the external air in degrees of Fahrenheit's thermometer, and divide the product by 2·1, the difference between 200, which is the temperature of the steam pipes, and the temperature of the house; the quotient

will be the surface of cast-iron pipe required.

Now, in the house of ordinary dimensions, if the lowest temperature in the night be fixed at 50°, and 10° are allowed for winds, and the external air is supposed to be at zero or 0 of Fahrenheit, then 1175 multiplied by 60°, and the product divided by 2·1, the difference between 200 and 60 will give us the quotient 236 = to the surface of pipe required. Now, the house being thirty feet long, five pipes of that length, and five inches in diameter, will be about the proper quantity.

If hot water be employed instead of steam, the following proportions and information, obtained from Mr. Rendle, may be adopted confidently as guides:— In a span-roof propagating-house, forty feet long, thirteen feet broad, seven feet high in the centre, and four feet high at the two fronts, having a superficial surface of glass amounting to 538 square feet, Mr. Rendle has a tank eighty-three feet long, running round three sides of the house, four feet wide, and about eight inches deep, and consequently capable of containing nearly 300 cubic feet of hot water, though only half that quantity is used. This is closely approaching to the size pointed out, according to Mr. Tredgold's formula. The mean temperature of a hot-water tank will never be much above 100°, so that, for the sized house mentioned by that skilful engineer, the divisor must be 2·1 times the difference between 100° and 60°, which gives as the quotient 335 cubic feet.

The tank in Mr. Rendle's propagating-house is built lined with Roman cement, and if the temperature at the time of lighting the fire be 90°, the temperature of the atmosphere of the house 67°, and the temperature out of doors 50°, the quantity of small coal or breeze required to raise the temperature of the water to 125° is 28 pounds. In twelve hours the water cools, after the fire has been extinguished, from 125° to 93°.

When steam is employed, the space

for steam in the boiler is easily found by multiplying the length of the pipe in feet by the quantity of steam in a foot in length of the pipe.

In the above-noticed house, the length of pipe five inches in diameter is 150 feet; and these multiplied by 1.363 = 20.5 cubic feet of steam, and as the pipe will condense the steam of about one cubic foot and one-third of water per hour, therefore the boiler should be capable of evaporating $1\frac{1}{2}$ cubic feet of water per hour, to allow for unavoidable loss. In the extreme cases of the thermometer being at zero, the consumption of coals to keep up this evaporation will be $12\frac{3}{4}$ pounds per hour.

Interior diameter of pipe in inches.	Decimal parts of a cubic foot of steam in each foot of pipe.
1	0.0645
1½	0.1225
2	0.2185
2½	0.34
3	0.49
4	0.873
5	1.063
6	1.964
7	2.67
8	3.49
9	4.42
10	5.45

These calculations are all founded upon the supposition that the condensed water is returned to the boiler whilst hot; but if this cannot be effected, then one-twelfth more fuel will be required. The boiler for the supply either of steam or hot water should be covered with the best available non-conductor of heat, and this is either charcoal or sand.

A case of brickwork, with pulverized charcoal between this and the boiler, is to be preferred to any other. A boiler having a surface of seventy feet exposed to the air, in a temperature of 32°, requires an extra bushel of coals to be consumed per day, to compensate for the heat radiated and conducted from that surface; and the smaller the boiler, the greater is the proportionate waste. The surface of the pipes should be painted black, because a surface of this colour gives out more heat in a given time than any other.

The temperature for a stove should be:—Winter: day, 60°-65°; night, 65°; summer: 65°-70°, rising with sun-heat. Where a great variety of plants are grown requiring different temperatures, those which require most heat may be grown in the warmer end, admitting all air at the cooler end if possible.

A plunging tank heated with pipes and filled with cocoanut-fibre is another essential to a stove, and should always

be provided where pits or other accommodation for this purpose are limited.

Bark or Moist Stove.—Mr. Loudon gives the following design and descrip-

tion of a moist stove, warmed on the old plan of deriving heat by the combined agency of bark and flues. Instead of a stage in the centre it has a pit, which may be from two and a half to four feet deep, according as bark or leaves are to be used, the latter material requiring the greatest depth. It is commonly surrounded by a thin brick wall; but planks of stone, or plates of slate or cast iron, are to be preferred. The roof, when necessary, may be supported by iron columns from the middle of the pit, *a*. Shelves may be placed against the back wall, *b*, and occasionally a narrow-leaved creeper run up the roof, *c*. We may add, that houses of this description are generally placed east and west against walls, on account of the shelter thereby obtained during winter, when a high degree of heat is kept up within, while the cold is excessive without.

Stranvæ'sia. (Named after the *Hon. W. F. Stranvæys, F.R.S.* Nat. ord., *Rosaceæ*; Tribe, *Pomeæ*.)

A beautiful and nearly evergreen shrub, but not quite hardy, except in the south of England. Grafting on the thorn; in cold places would like a little protection in winter.

S. glaucescens. 20. White. June. Nepal. 1828. B. R. t. 1856.

Stratio'tes. Water Soldier. (From *stratos*, an army; sword-like leaves. Nat. ord., *Hydrocharideæ*; Tribe, *Stratioteæ*.)

Hardy aquatics. Useful to plant in ponds, where it will soon cover a large space. Seeds and divisions; ponds and lakes.

S. alismoides. A synonym of *Ottelia alismoides*. — *aloides*. 2. White. June. England.

Strava'dium. (From the native name in Malabar. Nat. ord., *Myrtaceæ*; Tribe, *Lecythideæ*.) See **Barringtonia**.

Stove evergreen trees. Cuttings of ripened shoots in sand, under a bell-glass, and in a good, moist bottom-heat; fibry loam and peat, with a little charcoal and silver sand. Winter temp., 60° to 65°; summer, 65° to 90°.

S. acutangulum. See *Barringtonia acutangula*. — *insigne*. Fl. Ser. t. 654, 655. A synonym of

Barringtonia insignis.

S. racemosa. See *Barringtonia racemosa*.
— *rubrum*. See *Barringtonia acutangula*.

Strawberry. *Fraga'ria*.

Superior kinds.—These are President, Sir Joseph Paxton, Lucas, Black Prince, Bicton, British Queen, Dr. Hogg, Elton, Keen's seedling, Loxford Hall seedling, James Veitch, La Constance, La Grosse Sucrée, Pauline, Pioneer, Vicomtesse Héricart de Thury, etc., etc.

Soil.—A good loam of some depth is best adapted to high culture; for although strawberry walls are found to be highly conducive to flavour, yet they will not succeed well in such situations, unless a special provision of this kind be made for them. Therefore, loose and sandy soils must be mixed with marls or clays, and clayey soils must be rendered open by applying sand, road-scrapings, cinder-ashes (fine), burnt or charred material, etc. Boggy or peaty soils will require consolidation by burning, or the application of sound soil, and by thorough draining, if wet.

Propagation: by Runners and Seed.—Their propagation by runners is well known. Seed-sowing is resorted to for raising new varieties, and for heightening the culture of the Alpine class, which is, by most cultivators, treated as an annual.

Culture during the Growing Period.—Very little is necessary besides keeping them clear of weeds, and trimming all those runners away which are not required for future stock. All operations connected with root-culture should be carried out during the rest period. At the end of May the runners will begin to ramble freely, and at this time a very general spring-dressing should take place. This consists in hoeing and raking the ground thoroughly, choosing a dry period for the operation, in order that every weed may be destroyed; at the same time trimming away all the wires or strings on which the runners are produced. The next proceeding will be to place clean straw, grass-mowings, or tan beneath the trusses of fruit; this process requires a little nicety of handling. When the bloom trusses make their appearance, the next great point is to see that the plants never suffer from drought from this period to the moment they commence ripening.

Culture during the Rest Period.—We date our rest season from the period at which the last fruit is gathered, or soon after, say the end of August. At this period it will be found, that in spite of the trimming the plants received in May,

a profusion of runners will have been produced, the rambling foliage from which will obstruct the light from the older and principal leaves, which have, from this time forward, the important office of preparing for the formation of the ensuing year's blossom. The waste runners should therefore be trimmed away as soon as possible, for they also exhaust the soil by their roots. In cutting away these runners, great care must be exercised in preserving all the true leaves, which must by no means be cut. No further trimming need be practised until the following March, in the early part of which all the decayed and injured foliage may be cut away. The rows being three feet apart, at the end of October, one foot in the centre only is to be dug, thus leaving the plants one foot of roots on each side entirely undisturbed. Introduce some decayed manure annually in this centre, and the small amount of loss of root is more than compensated by the volume of new white fibres which, by the month of May following, have fully invested the new ground. The dung or vegetable matter should be somewhat fresh; such is preferable to rotten manure.

Making new Plantations.—Trenching should be had recourse to, going as deep as the good soil will permit, placing the manure necessary principally between the two spits. If the soil be shallow, of course the manure will be dug down with a single spit. If good runners can be obtained early in July, and carefully cultivated, they may be expected to bear a respectable crop the following summer. From those planted in February, of course, little can be expected. It is by far the best to keep a little nursery for runners in a very open situation, and the plants a long way apart.

Strawberry Walls or Banks.—These have been highly recommended, and are, doubtless, very useful, as heightening flavour. They have, however, never become very general, owing to their being rather expensive in constructing. A strawberry wall, in the direction of east and west, would be a useful adjunct in high gardening if properly managed. On the south side plant the Black Prince and the Keen's Seedling; and on the north side the Elton. The former would ripen a fortnight earlier than ordinary ones, and the latter continue bearing until October. These walls may be built of any kind of material which will maintain its position, and should be as near to an angle of 45° as can be ap-

proached. They may be thus constructed—

Strawberry Forcing.—One principal point here is to obtain very early runners, which is generally effected by laying the earliest in small pots, in a sound compost. These, when full of roots, are reported into larger ones; and the whole business henceforth is to give them kindly cultivation, as to regular waterings, etc., and to keep them in an open situation. By the end of September they will possess stout buds, and must be plunged up to their rims for the winter. Forcing must be commenced very gently, with plenty of atmospheric moisture,—say, commence with the temperature at 55°, and rise gradually, by the time the leaf is thoroughly developed, to 60°, and the less advance that is made beyond this the better, except in sunny weather. They love to be near the glass, and to have abundance of air.

Strawberry-Blite. *Blitum*.

Strawberry-Spinach. *Blitum*.

Strawberry-tree. *A'rbutus*.

Streblorrhiza. (From *streblos*, twisted, and *rhiza*, a root. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.)

Half-hardy, climbing shrub. For culture, see CLIANTHUS.

S. speciosa. 3. Flesh-coloured. May. Norfolk Island. 1840. Syn., *Clianthus carneus*. B. R. 1841, t. 51.

Streblus. (From *streblos*, twisted; referring to the branches. Nat. ord., *Urticaceæ*.)

A stove shrub or tree. Rich loam mixed with fibry peat. Seeds; cuttings.

S. asper. 20. Greenish. Tropical Asia. Paper Tree.

Strelitzia. Bird of Paradise Flower; Bird's-tongue Flower. (Named after Charlotte, queen to George III., of the house of *Mecklenburgh-Strelitz*. Nat. ord., *Scitamineæ*; Tribe, *Musceæ*.)

Stove, yellow-flowered, herbaceous perennials, from South Africa. By seeds in a good, moist heat, in spring; generally by suckers and dividing the plant; fibry loam and a little peat. Winter temp., 45° to 55°; summer, 60° to 80°.

S. albidus. See *S. quensoni*.

— *angustifolia*. See *S. parvifolia*.

— *augusta*. 18. White. March. 1791. B. M. tt. 4167—4168.

S. farinosa. 5. February. 1795.

— *citri'na*. Sepals citron-yellow. 1887.

— *Lemonie'rii*. 3. Yellow, blue. 1880.

— *prolifera*. A variety with two spathe.

— *pu'mila*. A dwarf variety. 1856.

Streptanthera. (From *streptos*, twisted, and *anthera*, an anther; referring to the shape of the anthers. Nat. ord., *Iridæ*; Tribe, *Ixiææ*. Closely allied to *Gladiolus*, with which it is sometimes united.)

Greenhouse bulbs. Sandy loam. Offsets.

S. cu'prea. 3. Copper. June. South Africa. 1825. Swt. Fl. Gard. ser. 2, t. 122.

— *e'legans*. 3. White, blue. May. South Africa. 1827. Swt. Fl. Gard. t. 209.

Streptocalyx. (From *streptos*, twisted, and *calyx*, a cup or calyx. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliææ*.)

Stove plants, requiring the same culture as *ÆCHMEA*.

S. Furstenbergii. 14. Pink. October. Bahia. 1877. Syn., *Æchmea Furstenbergii* and *Tillandsia Furstenbergii*.

— *Vallera'ndi*. 2. Bracts bright red; flowers violet. Amazon Valley. 1876. Belg. Hort. 1883, p. 13, t. 1, 2. Syn., *Lamprococcus Vallera'ndi*, Rev. Hort. 1887, p. 129.

Streptocarpus. (From *streptos*, twisted, and *carpos*, a fruit; the long seed-pod is twisted. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

Greenhouse, or stove, herbaceous perennials. By seeds in a gentle hotbed, in spring; also by dividing the plant; light, rich, sandy loam. Winter temp., 40° to 50°.

S. albidus. Garden hybrid. 1889.

— *azur'is*. Garden hybrid. 1889.

— *bisto'ro-polyanthus*. Pale bluish-lilac. Fl. Ser. t. 2429. Garden hybrid.

— *Brua'deni*. Hybrid between *S. Rexii* and *S. polyanthus*.

- *polyanthus*. 1. Natal. Purple. 1853. B. M. t. 4850.
- *Rezii*. $\frac{1}{2}$. Blue. June. South Africa. 1824. B. R. t. 1173. Syn., *Didymocarpus Rezii*. B. M. t. 3005.
- *Saundersii*. Blue, purple. Natal. 1861. B. M. t. 5251.
- *Watsonii*. Bright rose-purple. Autumn and winter. 1887. Hybrid between *S. kewen'sis* and *S. parviflora*. G. C. 1887, ii. pp. 137 and 215, fig. 52.
- *Wendlandii*. Clear blue. 1890.

Streptopus. (From *streptos*, twisted, and *pous*, a foot; flower-stalks twisted. Nat. ord., *Liliaceæ*; Tribe, *Polygonateæ*. Allied to *Uvularia*.)

Hardy herbaceous perennials. Seeds or divisions in spring; any good garden-soil.

- S. amplexifolius*. Red. Lil. t. 259. See *S. distortus*.
- *distortus*. 1. Greenish-white. May. Europe and North America. Syns., *S. amplexifolius*, *Uvularia amplexifolia* and *U. distorta*.
- *lanuginosus*. $\frac{1}{2}$. Yellow, green. June. N. America. 1812. Syn., *Uvularia lanuginosa*. B. M. t. 1490. Now known as *PROSARTES LANUGINOSUS*.
- *roseus*. $\frac{1}{2}$. Pink. June. N. America. 1806. Syn., *Uvularia rosea*. B. M. t. 1489.
- *simplex*. $\frac{1}{2}$. June. Nepaul. 1822.

Streptosolen. (From *streptos*, twisted, and *solen*, a tube; in allusion to the corolla tube. Nat. ord., *Solanaceæ*; Tribe, *Salpiglossideæ*.)

Greenhouse evergreen shrub. Seeds sown in a mild heat, in March, and potted when the seedlings are sufficiently large into light, rich soil.

- S. Jamesonii*. 4. Orange. June. Ecuador. 1847. Syn., *Browallia Jamesoni*. B. M. t. 4605.

Stricklandia. (After Sir C. W. Strickland, Bart., a successful cultivator of *Amaryllideæ*. Nat. ord., *Amaryllideæ*; Tribe, *Pantratieæ*.)

Stove bulb. For culture, see *STENOMESSON*.

S. eucrosioides. 1. Bright red. Spring. Andes of Ecuador. 1877. Syns., *Leperezia eucrosioides* and *Stenomesson Stricklandii*.

Striking. The process of causing cuttings to emit roots.

Stringy Bark Tree. A name applied to several species of *Eucalyptus*.

Strobilanthus. (From *strobilos*, a pine-cone, and *anthos*, a flower; resemblance of the head of flower. Nat. ord.,

Acanthaceæ; Tribe, *Ruellieæ*. Allied to *Ruellia*.)

Stove evergreen shrubs. Cuttings any time during summer in sandy soil, under a hand-light, in heat; fibry loam and sandy peat. Winter temp., 48° to 55°; summer, 80° to 80°.

- S. anisophyllus*. 3. Lavender. June. Silhet. 1823. Syns., *Goldfussia anisophylla*, B. M. t. 3404; *Ruellia anisophylla* and *R. persicifolia*, B. R. t. 955.
- *attenuatus*. Violet-blue. Himalayas. 1887. Gf. t. 1243. Greenhouse.
- *callosus*. Blue. May. E. Indies. 1840. Syn., *Ruellia callosa*.
- *coloratus*. Pale lilac-purple. Eastern Himalayas. 1887. B. M. t. 6922.
- *consanguineus*. Blue. Ceylon. 1873.
- *flaccidifolius*. Lilac-purple. India and China. 1887. B. M. t. 6947. This shrub yields a blue dye.
- *glomeratus*. 2-6. Purple. November. India. 1838. Syn., *Goldfussia glomerata*. B. M. t. 3881.
- — *speciosus*. A more showy variety. Syn., *Goldfussia glomerata*, var. *speciosa*. B. M. t. 4767.
- *isophyllus*. 2. Lavender. Autumn. India. 1845. Syn., *Goldfussia isophylla*. B. M. t. 4363, and Maund. Bot. t. 244.
- *lactatus*. 1. Pale lilac. September. E. Indies. 1847. B. M. t. 4366.
- *maculatus*. $\frac{1}{2}$. Pale lilac. September. 1846.
- *Sabinianus*. 4. Blue, purple. March. Nepaul. 1826. Syn., *Ruellia Sabiniana*. B. R. t. 1238.
- *scaber*. 3. Yellow. May. E. Indies. 1826. Syn., *Ruellia scabra*.
- *sessilis*. $\frac{1}{2}$. Pale purple. April. Bombay. 1836.
- *Walkii*. $\frac{1}{2}$ -2. Blue. October. India. 1858. Syn., *Goldfussia Thomsoni*. B. M. t. 5119.

Strobilorchis. (From *strobilos*, a fir cone, and *rachis*, a ridge; referring to the form of the inflorescence. Nat. ord., *Acanthaceæ*.) Now united with **Aphelandra**.

Stove shrub. For cultivation, see *RUELLIA*, to which it is allied.

- S. glabra*. Yellow. Brazil. 1852. Now known as *APHELANDRA HYDROMESTUS*.

Stroma'nthe. (From *stroma*, to strew, and *anthos*, a flower. Nat. ord., *Scitamineæ*; Tribe, *Marantææ*.)

Stove perennial evergreen herbs. Seeds; division of the plant in spring. Rich sandy loam, fibrous peat, and leaf-mould. Summer temp., 65° to 85°; winter, 58° to 65°.

- S. umbellata*. Brazil. 1875.
- *Lubbersii*. Leaves marbled with yellow above; under surface greyish. 1880. Belg. Hort. 1882, t. 1.
- *Porteana*. Leaves green above, paler beneath. 1859.
- *sanguinea*. A synonym of *Maranta sanguinea*.
- *spectabilis*. Lem. Jard. Fl. t. 401. See *Maranta spectabilis*.

Strophanthus. (From *strophos*, twisted, and *anthos*, a flower; divisions of petals twisted. Nat. ord., *Apocynaceæ*; Tribe, *Echitideæ*. Allied to *Nerium*.)

Stove evergreen shrubs. Cuttings of half-ripened shoots in sand, under a glass, in heat, in

- spring; fibry loam and sandy peat. Winter temp., 50° to 55°; summer, 60° to 85°.
- S. Bullenianus*. Yellow, purple. W. Tropical Africa. 1870.
- *capensis*. Orange, yellow. Cape of Good Hope. 1855. B. M. t. 5713.
- *chinensis*. See *S. divergens*.
- *dichotomus*. 3. Rosy. June. E. Indies. 1816.
- *chinensis*. See *S. divergens*.
- *divergens*. 3. Yellow. February. China. 1816. Syns., *S. chinensis* and *S. dichotomus*, var. *chinensis*. B. R. t. 469.
- *Ledeburii*. Yellow, purple. Congo. 1887. Gh. t. 1241.
- *sarmentosus*. 6. Red. June. Sierra Leone. 1824.

Stropholirion. (From *strophos*, twisted, and *lirion*, lily. Nat. ord., *Liliaceæ*; Tribe, *Alliaceæ*.) See **Brodiaea**.

S. californicum and *S. volubile* are synonyms of *Brodiaea volubilis*. B. M. t. 6123.

Struma'ria. (From *struma*, a tubercle; the style is enlarged at the bottom. Nat. ord., *Amaryllidaceæ*; Tribe, *Amaryllidaceæ*. Allied to Nerine and Hessea.)

Bulbs, from South Africa. For culture, see NERINE.

- S. angustifolia*. ½. Pink. April. 1795. Jacq. Ic. t. 359.
- *erispata*. B. M. t. 1363. See *Hessea crispata*.
- *filifolia*. Jacq. Ic. t. 361. See *Hessea filifolia*.
- *gemmata*. B. M. t. 1620. See *Hessea gemmata*.
- *linguifolia*. ½. White. April. Jacq. Ic. t. 356.
- *rufifolia*. ½. Pink. May. 1795. Jacq. Ic. t. 358.
- *spiralis*. B. M. t. 1383. See *Carpolyza spiralis*.
- *stellaris*. See *Hessea stellaris*.
- *truncata*. ½. White. April. 1795. Jacq. Ic. t. 357.
- *undulata*. ½. White. May. 1820. Jacq. Ic. t. 360.

Struthi'ola. (From *strouthion*, a little sparrow; resemblance of seeds to a beak. Nat. ord., *Thymelaceæ*; Tribe, *Eruthymeleæ*. Allied to Gnidia.)

Greenhouse evergreens, from South Africa. Cuttings of the points of shoots, two or three inches in length, in sand, under a bell-glass, in May; sandy, fibry peat and a little charcoal. Winter temp., 40° to 47°.

- S. angustifolia*. 3. Yellow. July. 1816.
- *ciliata*. 2. White. June. 1779. Andr. Rep. t. 139. Andr. Rep. t. 149 is *S. virgata*.
- *erecta*. B. M. t. 2138. See *S. stricta*.
- *glabra*. 2. Yellow. June. 1820.
- *imbricata*. 2. Yellow. June. 1794. Andr. Rep. t. 133.
- *incana*. 2. White. August. 1817.
- *juniperina*. 2. White. June. 1758. B. C. t. 75.
- *lateriflora*. 2. Yellow. July. 1819.
- *longiflora*. 2. Yellow. July. 1823.
- *lucens*. 2. Yellow. June. 1817.
- *ovata*. 2. White. April. 1792. Andr. Rep. t. 119.
- *pube'scens*. 3. Red. June. 1790. B. M. t. 1212.

- S. striata*. 2. Yellow. July. 1820.
- *stricta*. 1½. White. June. 1798. Syn., *S. erecta* of Curtis (not Linnæus).
- *tomentosa*. 2. Yellow. August. 1799. Andr. Rep. t. 334.
- *virgata*. 2. Red. June. 1779. Syn., *S. ciliata* of Andr. Rep. t. 149.

Struthio'pteris. (From *strouthios*, an ostrich, and *pteris*, a fern; resemblance of the leaves, or fronds, to its feathers. Nat. ord., *Filices*.)

Hardy, brown-spored ferns. See FERNS.

- S. germanica*. 2. July. Europe. 1760.
- *orientalis*. Japan. 1869.
- *pennsylvanica*. 2. August. N. America. 1812.

Strychnoda'phne. (From *strychnos*, a name of a plant mentioned by Theophrastus, and *daphne*, Daphne, a nymph. Nat. ord., *Lauraceæ*; Tribe, *Litsæaceæ*.)

Stove evergreens. For culture, see LAURUS.

- S. floribunda*. 40-60. Yellow. West Indies. 1800. Syns., *Laurus exaltata* and *L. floribunda*.
- *puberula*. 40. White. Cayenne. 1800. Syn., *Laurus crassifolia*.

Stryphnode'ndron. (From *struphinos*, acid, and *dendron*, tree. Nat. ord., *Leguminosæ*; Tribe, *Adenanthereæ*.)

Stove shrub. For culture, see ACACIA.

- S. guianense*. 30-40. White. November. Cayenne. Syns., *Acacia guianensis*, *Mimosa guianensis* and *Piptadenia guianensis*.

Stua'rtia. (Named after John Stuart, Marquis of Bute. Nat. ord., *Ternstroemiaceæ*; Tribe, *Gordoniaceæ*. Allied to Gordonia.)

Hardy, white-flowered, deciduous shrubs. Generally propagated by layers; moist peat soil, or deep, moist, sandy loam.

- S. grandiflora*. See *S. pseudo-camellia*.
- *marylandica*. See *S. virginica*.
- *ovata*. See *S. pentagyna*.
- *pentagyna*. 10. Cream-coloured. Summer. North America. 1785. B. M. t. 3918. Syns., *S. ovata* and *Malaecodendron ovatum*. B. R. t. 1104.
- *pseudocamellia*. 12. Creamy-white. Summer. Japan. 1879. Syn., *S. grandiflora*.
- *virginica*. 8. White. April. North America. 1743. Syn., *S. marylandica*.

Styla'ndra. (From *stylos*, a column, and *aner*, a male; in allusion to the arrangement of the stamens. Nat. ord., *Asclepiadaceæ*.) See **Podostigma**.

S. pulmita. See *Podostigma pubescens*.

Styli'dium. (From *stylos*, a column; the stamens and style are joined into a column. Nat. ord., *Stylidiaceæ*.)

All Australian plants. Herbaceous, by divisions, and by seeds in spring; shrubs, by cuttings of young shoots in sand, under a bell-glass; fibry, sandy loam, and a little peat and vegetable mould. Winter temp., 40° to 45°.

GREENHOUSE EVERGREENS.

Stylocoryna. (From *stylos*, a column, and *koryne*, a club; shape of the style. Nat. ord., *Rubiaceae*; Tribe, *Gardenieae*.)

Stove, white-flowered, East-Indian evergreens. Cuttings of young shoots in sand, under a bell-glass in heat; fibry, sandy loam and peat. Winter temp., 45° to 55°; summer, 60° to 85°.
S. coriacea. 1828.
corymbosa. 5. 1759.
cymosa. 1811.

Stylolepis. (From *stylos*, a column, and *lepis*, a scale; the flower-stalks are scaly. Nat. ord., *Compositae*; Tribe, *Inuloidae*.) See *Podolepis*.
S. gracilis. A synonym of *Podolepis gracilis*.

Stylophorum. (From *stylos*, a column, and *phero*, to bear; in allusion to the long style. Nat. ord., *Papaveraceae*; Tribe, *Eupapaverae*. Allied to *Cathartina*.)

Hardy herbaceous perennials. Seeds in the open border in April; divisions of the root. Light garden-soil.

- S. diphyllum*. $\frac{3}{4}$. Yellow. June. Western United States. 1854. B. M. t. 4867. Syns., *S. ohioense*, *S. petiolatum*, *Chelidonium diphyllum*, *Meconopsis diphylla* and *M. petiolata*.
 — *japonicum*. $1\frac{1}{2}$. Yellow. May. Japan. 1870. B. M. t. 5830. Syn., *Chelidonium japonicum*.
 — *ohioense*. } See *S. diphyllum*.
 — *petiolatum*. }

Stypandra. (From *styphe*, tow, and *aner*, an anther; resemblance of the anthers. Nat. ord., *Liliaceae*; Tribe, *Asphodeleae*. Allied to *Dianella*. Syn., *Styponema*.)

Greenhouse Australian plants. Division of the plant in spring; sandy loam and fibry peat; require the protection of a dry, cold pit in winter.

- S. caespitosa*. 1-2. Blue or yellowish. June. 1824.
 — *frutescens*. Kn. and West. t. 63. See *S. glauca*.
 — *glauca*. 1-3. Blue. June. 1823. Syns., *S. frutescens* and *S. propinqua*. B. M. t. 3417.
 — *umbellata*. $\frac{3}{4}$. White or yellowish. June. 1826.

Styphelia. (From *styphe*los, hard; referring to the wood. Nat. ord., *Epacridaceae*; Tribe, *Styphelieae*.)

Greenhouse Australian evergreens. Cuttings of young shoots in sand, under a bell-glass, in April; sandy, fibry peat, and only a little fibry loam. Winter temp., 38° to 48°.

- S. amplexicaulis*. Linn. Trans. viii. t. 8. A synonym of *Leucopogon amplexicaulis*.
 — *epacridioides*. 6. Crimson. July. 1823.
 — *glauca*. A synonym of *Monotoca lineata*.
 — *lactea*. 4. Pink. June. 1823. Syn., *S. latifolia*.
 — *latifolia*. See *S. lactea*.
 — *longifolia*. 3. Green. June. 1807. B. R. t. 24.
 — *parvifolia*. Andr. Rep. t. 287. See *Leucopogon Richei*.
 — *Richei*. A synonym of *Leucopogon Richei*.
 — *splendens*. See *Asteroloma splendens*.
 — *triflora*. 6. Pink. July. 1796. Andr. Rep. t. 72.
 — *tubiflora*. 6. Scarlet. July. 1802. B. C. t. 1938.
 — *viridiflora*. See *S. viridis*.
 — *viridis*. 4. Green. May. 1791. Andr. Rep. t. 312. Syn., *S. viridiflora*. B. C. t. 1223.

Styphnolobium. (From *styphe*on, contracted, and *lobos*, a pod; the pods are generally constricted between the seeds. Nat. ord., *Leguminosae*; Tribe, *Sophoreae*.) See *Sophora*.
S. japonicum. See *Sophora japonica*.

Styrax. Storax. (From the Arabic. Nat. ord., *Styracaceae*.)

Hardy deciduous, white-flowered shrubs, except where otherwise stated. By imported seeds, also by cuttings and layers; light, rich, sandy loam, and a little peat; should be planted against a wall to bloom profusely, and it is well worthy of such protection; next to that a dry, protected situation.

 — — *virgata*. 6. Buds sometimes pinkish outside. Japan. 1868. Syn., *S. japonicum*. Gf. t. 583.

Succulent Plants are so characterized on account of their thick juicy leaves or stems. They are formed to exist, says Mr. Fortune, in countries and situations where they are often exposed to intense light and dryness; their skins are thick; they have few evaporating pores; and they have, likewise, few roots to gorge their tissue with food during the rainy season. Therefore, we find the dry, sandy plains of the Cape abounding in *Aloes* and *Mesembryanthemums*; and the bare volcanic rocks of Mount Etna covered, in many places, with the common *prickly pear*. In Mexico, also, and in many other parts of Central and South America, the extensive race of *Cacti*, with their curious forms, are at home, and flourish even in those dry and parched seasons when the whole face of nature besides seem withered and destroyed. The natural circumstances in which these plants are found are sure and certain guides in cultivation.

Suckers are branches naturally thrown up by a plant from its base, when the onward current of growth of the stem is stopped.

Suffocation is a term employed by Keith and others to describe any stopping of the transpiratory organs of plants, whether it arises from extravasated sap, mosses, fungi, or from a deficient supply of sap.

Sugar Bakers' Refuse. See **Animal Matters.**

Sugar Cane. *Saccharum officinarum*.

Sumach. *Rhus*.

Summer Snowflake. *Leucojum aestivum*.

Sun-dew. *Drosera*.

Sunflower. *Helianthus*.

H. annuus, Annual Sunflower, is cultivated in southern Europe for its oil, and as a food for cattle and poultry.

The earlier the seed can be got into the ground the better, say the beginning of April, as the crop will be ready to harvest the latter part of August, which will be of the greatest importance to growers. The necessary quantity of seed required for an acre depends upon the conditions of the soil, and varies from four pounds to five pounds; but, of course, it is advisable to sow a little more than is actually wanted, to provide against accidents. The seed should be drilled into the ground, and the distance from row to row eighteen inches; the plants to be thinned out to thirty inches from plant to plant, and the number of plants at this distance would be about 14,500 per acre; at eighteen inches from plant to plant, 25,000 per acre; and at twelve inches from plant to plant, 32,000. The produce of this kind of grain, like that of most others, varies considerably, according to the state of the soil, climate, and the cultivation that is employed; but the average quantity of seed is about fifty bushels per acre. This will produce fifty gallons of oil, and of oilcake, 1,500 pounds. The stalks, when burnt for alkali, give ten hundredweight of potash.

Sun-fruit. *Heliocarpus*.

Sun Plant. *Portulaca grandiflora*.

Sun-rose. *Helianthemum*.

Surface Grubs, or Caterpillars, are the larvæ of several species of *Noctua*, or *Night Moths*. Gardeners thus name them because they attack the roots of the turnip, mangold wurtzel, etc., just at the surface of the soil.

Susa'rium. (From *sousarion*, a small lily; supposed resemblance to a lily. Nat. ord., *Iridæ*; Tribe, *Sisyrinchieæ*.)

S. Segethi. Violet, yellow. Temperate South America. Gf. t. 1117, fig. 1.

Su'sum. (From the native name. Nat. ord., *Flagellariaceæ*.)

Stove plant, with the habit of a *DRACÆNA*.

S. anthelminticum. Reddish. Sumatra. 1889. Rev. Hort. 1889, p. 76, fig. 23.

Sutherlandia. (Named after *James Sutherland*, author of a botanical catalogue. Nat. ord., *Leguminosæ*; Tribe, *Galegæ*. Allied to *Chianthus*.)

Half-hardy, scarlet-flowered evergreens, from South Africa. Seeds in spring, or cuttings of young shoots in May, under a hand-light: require protection in hard winters.

- S. frutescens*. 3. June. 1683. Syn., *Colutea frutescens*. B. M. t. 181. Cape Bladder Senna.
 — *canescens*. June. 1816.
 — *obcordata*. Marr. Mag. 1839, t. 7.
 — *microphylla*. 3. June. 1816.

Sutto'nia. (In honour of the Rev. Dr. Sutton, F.L.S. Nat. ord., *Myrsinaceæ*; Tribe, *Eumyrsineæ*.)

Greenhouse evergreen shrub. For cultivation, see MYRSINE, to which it is allied.

S. australis. 10. New Zealand. Now known as MYRSINE URVILLEI.

Suwarrow-Nut. *Ca'ryocar*.

Swainso'nia. (Named after Isaac Swainson, F.R.S. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*. Allied to *Colutea*.)

Greenhouse Australian evergreen shrubs. Seeds in a slight hotbed in April, after being soaked in warm water, or they may be sown when ripe; cuttings of young shoots in sand, under a bell-glass, and kept in a cool frame or pit any time in summer; sandy, fibry loam, and a third of peat. Winter temp., 38° to 45°. They would no doubt succeed against a protected conservatory wall.

S. astragalifolia. See *S. lessertifolia*, var. *astragalifolia*.

— *atrococtinea*. Garden variety. 1887.

— *canescens*. 1-2. Blue, or violet-purple. May. Syn., *Cylogyne canescens*.

— *coronillofolia*. 2. Purple. July. 1802. Salis. Parad. t. 28; B. M. t. 1725.

— *alba*. White. 1889.

— *Ferrandi'aba*. Pale yellowish in bud, snow-white when fully open. Garden variety 1886.

— *Froebelii*. 1. Violet. Gfl. 1854, t. 89.

— *galegifolia*. 2. Red. July. 1800. Syn., *Colutea galegifolia*. B. M. t. 792.

— *albiflora*. 2. White. July. 1826. B. R. t. 994.

— *Greyana*. 2. Pink. July. 1844. B. R. 1846, t. 66.

— *lessertifolia*. 2. Purple. July. 1824.

— *astragalifolia*. White. July. 1802. Syn., *S. astragalifolia*.

— *magniflora*. Flor. Mag. t. 273. A superior form of *S. Greyana*.

— *occidentalis*. Purple. W. Australia. 1865. B. M. t. 5490.

— *Osbornii*. Rose, becoming violet with age. Autumn. 1851. Lem. Jard. Fl. t. 304.

— *procumbens*. Purple. Summer. 1862. Syn., *S. violacea*.

— *purpurea*. A form of *S. galegifolia*.

— *violacea*. See *S. procumbens*.

Swallowwort. *Asclepias* and *Chelidonium*.

Swammerdamia. (Named after J. Swammerdam, naturalist. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*.) A synonym of *Helichrysum*.

Half-hardy evergreens. For culture, see *PODOLAPIS*.

S. antennaria. 3. White. January. Van Diemen's Land. Journ. Hort. Soc. iv. p. 77. A synonym of *Helichrysum antennarium*.

— *glomerata*. 6. White. May. New Zealand. 1851.

Swamp Dogwood. *Ptelea trifoliata*.

Swamp Hickory. *Carya amara*.

Swamp Locust Tree. *Gleditsia monosperma*.

Swamp Post. *Quercus lyrata*.

Swamp Rose-Mallow. *Hibiscus moscheutos*.

Swamp Sassafras, or Laurel. *Magnolia glauca*.

Swamp Saxifrage. *Saxifraga vennesylvanica*.

Swamp White Oak. *Quercus bicolor*.

Swan-neck, or Swan-Wort. *Cyanocheilus*.

Swan River Daisy. *Brachycome*.

Swartzia. (Named after Dlof Swartz, a German botanist. Nat. ord., *Leguminosæ*; Tribe, *Swartzieæ*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass, and in bottom-heat, in the beginning of summer; sandy, fibry loam and peat in equal proportions. Winter temp., 50°; summer, 60° to 85°.

S. grandiflora. 6. Yellow. Trinidad. 1821.

Syn., *S. simplicifolia*.

— *pinna*. 6. Yellowish. June. West Indies. 1817.

— *simplicifolia*. See *S. grandiflora*.

Swedish Beam-tree. *Pyrus intermedia*.

Swedish Juniper. *Juniperus communis*, var. *fastigiata*.

Sweeping. (See *Besom*.) It is best done in calm weather, and early, whilst the dew is strong enough to allay the dust, and keep the light refuse from blowing about.

Sweet Acorn Oak. *Quercus Balota*.

Sweet Alyssum. *Kæ'niga maritima*.

Sweet Amber. *Hypericum Androsænum*.

Sweet Basil. *Ocimum basilicum*.

Sweet Bay. *Laurus nobilis*.

Sweet Briar. *Rosa rubiginosa*.

Sweet Broom. *Scoparia dulcis*.

Sweet Calabash. *Passiflora maliformis*.

Sweet Cassava. *Manihot Aipi*.

Sweet Chestnut. *Castanea sativa*.

Sweet Cicely. *Chærophyllum aromaticum*. See *Chervil*. This name is also applied to *Myrrhis odorata*.

Sweet Flag. *Acorus Calamus*.

Sweet Gale. *Myrica Gale.*

Sweet Gum. *Liquida'mbar styraciflua.*

Sweetia. (After Robert Sweet, 1783-1835, a nurseryman at Stockwell, and author of numerous botanical works. Nat. ord., *Leguminosæ*; Tribe, *Sophoreæ.*) See **Galactia.**

S. filiformis. See *Galactia filiformis.*
— *lignosa.* A synonym of *Galactia tenuifolia.*
— *longifolia.* See *Galactia longifolia.*

Sweet Lime. *Citrus Limetta.*

Sweet Marjoram. *Origanum majorana.*

Sweet Maudlin. *Achillea ageratum.*

Sweet Orange. *Citrus Aurantium.*

Sweet Pea. *Lathyrus odoratus.*

Sweet Potato. *Batatas edulis.*

Sweet Scabious. *Scabiosa atropurpurea.*

Sweet-scented Crab. *Pyrus coronaria.*

Sweet-scented Verbena. *Lippia citriodora.*

Sweet Sop. *Anona squamosa.*

Sweet Sultan. *Centaurea moschata.*

Sweet William. *Dianthus barbatus.*

Swertia. Felwort. (Named after E. Swert, a Dutch florist. Nat. ord., *Gentianæ*; Tribe, *Swerticæ.* Syn., *Ophelia.*)

Hardy plants; all annuals except *S. Michauxiana* and *S. perennis.* Seeds in spring; a marshy, peaty soil.

S. alata. 2. Greenish-yellow, with purple veins. Summer. India. 1868. Syn., *Ophelia alata.* B. M. t. 5687.

— *angustifolia.* 2. White, with dark blue spots. Summer. India. 1868. Syn., *Ophelia angustifolia.* B. M. t. 5687, figs. 3-4.

— *corniculata.* 3. Pale green. August. Siberia. 1817. Syn., *Halenia sibirica.*

— *corymbosa.* 1. Pale blue, or white with blue spots. May. India. 1836. Syn., *Ophelia corymbosa.* B. M. t. 4489.

— *Michauxiana.* 3. Green, yellow. July. North America. 1824. Biennial.

— *paniculata.* 1. White, purple or green. India. 1868. Syn., *Ophelia paniculata.* B. M. t. 5687, figs. 5-6.

— *perennis.* 1. Purple. July. England. Marsh Felwort. Perennial.

— *purpurascens.* 1-3. Purple. June. India. 1840. Syn., *Ophelia purpurascens.*

— *rotata.* A synonym of *Pleurogyne carinthiaca.*

— *trichotoma.* 13. White. Summer. India. 1863. Syn., *Ophelia umbellata.* B. M. t. 5397.

Swietenia. Mahogany. (Named after Von Swieten, a Dutch botanist. Nat. ord., *Meliaceæ*; Tribe, *Swietenia.*)

Stove evergreen trees. Cuttings of half-ripened shoots in sand, under a hand-light, and in bottom-heat; sandy, fibry loam. Winter temp., 50° to 60°; summer, 60° to 85°.

S. Chloroxylon. A synonym of *Chloroxylon Swietenia.*

— *febrifuga.* 50. White, yellow. E. Indies. 1796.

— *maha'gani.* 80. Red, yellow. W. Indies. 1734.

Swift Moth. See **Otter Moth.**

Sword Fern. *Xiphopteris.*

Sword Lily. *Gladiolus.*

Syagrus. (After an ancient poet. Nat. ord., *Palmeæ*; Tribe, *Cocoinæ.*)

Stove palms. Seeds; sandy loam, in a warm, moist plant-stove.

S. amara. 25. Martinique. 1850.

— *botryophora.* See *Cocos botryophora.*

— *campestris.* 10. Yellowish. Brazil.

— *coco'des.* See *Cocos Syagrus.*

— *comosa.* 10. Brazil. Syn., *Cocos comosa.*

— *Mikania'na.* See *Cocos Mikaniana.*

— *Sanco'na.* 60. Brazil.

Sycamine Tree. *Morus.*

Sycamore Tree. *Acer pseudoplatanus.*

Sycamore Fig Tree. *Ficus Sycomorus.*

Sycomorus. (So named from one species being thought to be the Sycamore of the Bible. Nat. ord., *Urticacæ*; Tribe, *Moracæ.*) Now united with **Ficus.**

Stove trees. For cultivation, etc., see **FICUS.**

S. antiquorum. 30. Egypt. A synonym of *Ficus Sycomorus.*

— *cape'nsis.* 4. Cape of Good Hope. 1816. A synonym of *Ficus variegata.*

Symphonia. (From *sumphonia*, regularity; referring to the regularity of the flowers and fruit. Nat. ord., *Guttiferæ.*) A synonym of **Moronebea.**

S. globuliflora. A synonym of *Moronebea coccinea.*

Symphoria. (From *sumphoreo*, to bear together. Nat. ord., *Caprifoliacæ*; Tribe, *Lonicercæ.*) See **Symphoricarpus.**

S. glomerata. See *Symphoricarpus vulgaris.*

— *foliis variegatis.* See *Symphoricarpus vulgaris*, var. *foliis variegatis.*

— *montana.* See *Symphoricarpus microphyllus.*

— *racemosus.* B. M. t. 2211. See *Symphoricarpus racemosus.*

Symphoricarpus. (From *sumphoreo*, to bear together, and *karpos*, a fruit; clustered fruit. Nat. ord., *Caprifoliacæ*; Tribe, *Lonicercæ.*)

Hardy deciduous shrubs, from North America. Cuttings in autumn, and freely by suckers; good, common soil. The flowers of *racemosus* are hunted after by bees, and its masses of white

fruits are grateful to many birds, besides looking very pretty in winter.

- S. acutus*. North West America. 1888.
— microphyllus. 6. Pink. August. Mexico. 1829. Syn., *S. montanus*, Maund, Bot. i. t. 20, and *Symphoria montana*.
— montanus. See *S. microphyllus*.
— occidentalis. 6. Pinkish. July.
— Heveri. Rosy. Colorado. 1888.
— puniceus. 4. Red. July. 1815.
— racemosus. 6. Rose. August. 1817. Syn., *Symphoria racemosa*. B. M. t. 2211.
— — pacificus. A variety with but one or two flowers in the axils of the upper leaves.
— vulgaris. 6. White. August. 1730. Syn., *Symphoria glomerata*.
— — foliis-variegatis. 6. Pink. August. Syn., *Symphoria glomerata*, var. *foliis variegatis*.

Symphya'ndra. (From *sumphio*, to grow together, and *aner*, *andros*, an anther; in allusion to the connate anthers. Nat. ord., *Campanulaceæ*.)

Hardy, perennial herbs. Rich sandy loam. Division of roots; seeds.

- S. armena*. 2. Blue. June. Orient. 1836.
— Hoffmanni. 1-2. White. Bosnia. 1884. G. C. 1888, iv., p. 760, fig. 107.
— pendula. 2. Cream. July. Orient. 1823. Swt. Fl. Gard. ser. 2, t. 66.
— Wanneri. 1. Blue. Summer. Alps. Syn., *Campanula Wanneri*.

Symphyoglossum. (From *sumphio*, to grow together, and *glossa*, a tongue. Nat. ord., *Asclepiadaceæ*.) A synonym of **Cynanchum**.

Symphyostemon. (From *sumphio*, to grow together, and *stemon*, a stamen. Nat. ord., *Iridææ*; Tribe, *Sisyrinchææ*.) See **Solenomelus**.

S. narcissoides. See *Solenomelus bistorus*.

Symphytum. Comfrey. (From *sumphio*, to make unite; and healing qualities. Nat. ord., *Boraginææ*; Tribe, *Boragææ*.)

Division of the plant, chiefly in spring; good, common soil, and a rather shady situation, where few herbaceous plants would flourish.

HARDY TUBEROUS-ROOTED.

- S. bohemicum*. See *S. officinale*, var. *variegatum*.
— officinale. 4. White. June. Britain. Eng. Bot. ed. 3, t. 1115.
— bohemicum. 3. Crimson. May. Bohemia. 1810. Syn., *S. bohemicum*.

— cordatum. 2. Cream. June. Transylvania. 1813.

- S. echinatum*. Purple. May. 1824.
— orientale. 3. White. May. Turkey. 1752. B. M. t. 1912.
— peregrinum. 2. July. Podolia. 1816.
— tauricum. 3. White. June. Tauria. 1806. B. M. t. 1787.
— — bullatum. 2½. Pale yellow. June. Caucasus. 1818. Syn., *S. bullatum*. B. C. t. 1862.

Sympie'za. (From *sumpiezo*, to press; the stamens compressed in the tube. Nat. ord., *Ericaceæ*; Tribe, *Ericææ*.)

Greenhouse evergreen. Cuttings of the points of shoots a couple of inches long, the base part being a little firm, in sand, under a bell-glass; sandy, fibry peat. Winter temp., 38° to 45°.

S. capitellata. 1½. July. South Africa. 1812.

Symplocos. (From *sumploke*, a connection; and stamens united. Nat. ord., *Styracææ*.)

Greenhouse evergreen shrubs, except *S. Sumniti*, which requires stove treatment. Cuttings of half-ripened shoots in sand, under a glass; sandy, fibry loam, and a little fibry peat. Winter temp., 40° to 45°. The *coccinea* will require 10° more heat but similar treatment otherwise. *S. sinica* should have a place on a conservatory wall.

- S. coccinea*. Rose. Mexico. 1825.
— cratogeoides. White. April. Nepaul. 1824
— japonica. Yellow. Japan. 1850.
— sinica. 3. White. May. China. 1822.
— Sumniti. Whitish. Summer. Nepaul. 1833. Gf. t. 1073, figs. c-g. Stove.
— tinctoria. 3. Yellow. Carolina. 1780.

Synadenium. (From *sun*, united, and *aden*, a gland; because the glands of the involucre are united in a cup or disc. Nat. ord., *Euphorbiaceæ*; Tribe, *Euphorbiææ*. Allied to *Euphorbia*.)

Stove perennial succulent shrub. For cultivation, see **PEDILANTHUS**.

- S. Gravnii*. 3. Crimson. Central Africa. 1867. B. M. t. 5633.

Syna'ndra. (From *sun*, together, and *aner*, anther; in that the anthers are in pairs. Nat. ord., *Labiataæ*; Tribe, *Stachydeææ*. Allied to *Melittis*.)

Hardy herbaceous perennial. Seeds, and division in spring; dry, sandy soil.

- S. grandiflora*. Yellow. June. N. America. 1827.

Synanthe'rias. (From *sun* together, and *anthera*, an anther. Nat. ord., *Aroideææ*.)

Stove aroid. For culture, see **AMORPHOPHALLUS**.

- S. sylvatica*. Spathe whitish, with green spots; spadix yellow. May. India. B. M. t. 7190. Syn., *Amorphophallus zeylanicus* and *Arum sylvaticum*.

Synaphe'bium. (From *sun*, together, and *phleps*, a vein; the veins on the fronds. Nat. ord., *Filicesæ*.)

Stove, brown-spored ferns. See **FERNES**.

- S. lobulosum*. May. E. Indies.
— obtusum. May. Malacca.
— pectinatum. May. E. Indies.
— recurvatum. May. Malacca.

Synecha'nthus. (From *suneches*, continuous, and *anthos*, a flower; referring to the inflorescence. Nat. ord., *Palmeæ*; Tribe, *Arceæ.*)

Stove palm. For culture, see *CHAMÆDORA*. *S. fibrosus*. 4. Guatemala. B. M. t. 6572.

Syneile'sis. See *Senecio*.

Syngonium. (From *sun*, confluent, and *gone*, the womb; referring to the cohesion of the ovaries. Nat. ord., *Aroidæ*; Tribe, *Philodendrea.*)

Stove evergreen climbers. For cultivation, see *PHILODENDRON*.

S. affine. Green, yellowish. Brazil. Syn., *S. gracile*.

— *albobineatum*. See *S. podophyllum*, var. *albobineatum*.

— *auritum*. Purple, yellow. Jamaica. Five Fingers.

— *gracile*. See *S. affine*.

— *podophyllum a'lbolineatum*. Leaves green, with silvery-grey veinings. Central America. Syns., *S. albobineatum* and *S. Seemannii*.

— *Riedelia'num*. Green, white. Brazil. 1860. A form of *S. Vellozianum*.

— *Vellozia'num*. Green, yellowish. Rio Janeiro.

— *Wendlandii*. Costa Rica.

Synnotia. (In honour of *W. Synnot*, who collected plants in South Africa. Nat. ord., *Iridææ*; Tribe, *Ixiææ.*)

Greenhouse bulbs, all natives of South Africa.

S. bicolor. †. Brown, yellow. March. 1786.

Syns., *Ixia bicolor*, B. M. t. 548; *Gladiolus bicolor*, Jacq. Ic. t. 240; and *Sparaxis bicolor*.

— *galeata*. 1. Brown, yellow. April. 1825. Syns., *Gladiolus galeatus*, Jacq. Ic. t. 255, and *Sparaxis galeata*.

— *variegata*. †. Variegated. May. 1825. Swt. Fl. Gard. t. 150.

Synthyris. (From *sun*, together, and *thyris*, a little door; referring to the valves of the fruit. Nat. ord., *Scrophulariææ.*)

Hardy, perennial herbs. For culture, see *VERONICA*.

S. pinnatifida. †. Dark blue. Rocky Mountains. 1889.

— *reniformis*. †. Pale violet. April. California. 1885. B. M. t. 6860.

Syrian Thistle. *Noto'basis syri'aca*.

Syringa. The Lilac. (From *syrinx*, the Persian name. Nat. ord., *Oleaceæ*; Tribe, *Syringææ.*)

Hardy deciduous shrubs. Layers and suckers generally; scarce kinds by budding or grafting; close-headed ones, grafted standard-high on the ash, would look very interesting; common garden-soil.

S. amurensis. See *S. japonica*.

— *Bretschneideri*. See *S. villosa*.

— *chine'nsis*. 4. Violet. May. 1795. A hybrid. Syns., *S. dubia* and *S. rothomagensis*.

— *du'bia*. See *S. chinensis*.

— *Emo'di*. 10. White. April. Himalayas. B. R. 1845, t. 6.

— *au'rea*. Leaves blotched with dull yellow. 1886. Garden variety.

S. Emo'di fo'liis variegatis. Garden variety.

— *ro'sea*. See *S. villosa*.

— *hyacinthiflora*. Garden hybrid. 1889.

— *japo'nica*. Creamy white. Japan. G. C. 1886, xxv. p. 561, fig. 123. Syns., *S. amurensis* and *Ligustrina amurensis*.

— *Josike'a*. 8. Deep lilac. June. Germany. 1833. B. M. t. 3278.

— *obla'ta*. 10. Purple. China. 1859. There is a white variety.

— *pekin'e'nsis*. White. North China. Gard. and For. ill., p. 165, fig. 30. Syn., *Ligustrina pekinensis*.

— *pendula*. A variety with drooping branches.

— *persica*. 5. Purple. May. Persia. 1640.

— *a'iba*. 2. White. May. Persia.

— *integrifolia*. Leaves undivided. Syn., *S. persica* of B. M. t. 486.

— *laciniata*. 5. Purple. Leaves incised. May. Persia.

— *sarvifolia*. 5. May.

— *pube'scens*. 3-5. Pale rose. North China. 1888. Gard. and For. 1888, i. p. 414, fig. 67.

— *rothomage'nsis*. See *S. chinensis*.

— *villosa*. 6. Bluish-purple. May. North China. 1880. Syns., *S. Emo'di*, var. *rosea*, and *S. Bretschneideri*.

— *vulgaris*. 8. Red, bluish-violet, or white. May. Persia. 1597. Common lilac; Pipe Tree.

— *a'iba*. 5. White. May. Persia.

— *a'iba-ma'jor*. 5. White. May.

— *a'iba-pl'e'na*. 5. White. May.

— *cæru'lea*. Blue.

— *grandiflora*. Red. Flowers large.

— *purpurea*. Violet-purple.

— *ru'bra*. 10. Red. May.

— *ru'bra-ma'jor*. 10. Red. May.

— *ru'bra-pl'e'na*. 10. Red. May.

— *violacea*. 8. Purple. May. Persia.

B. M. t. 183. Scotch lilac.

Syringa, Mock. *Philadelphus coronarius*.

Syringe. This is a most useful implement for impelling water over plants in pots, wall-trees, etc. When the object is merely to refresh the plants, the operator should stand at some distance from the plants, so that the water may spread and fall upon them like a shower. But if aphides have to be destroyed, he may be closer to the plants, and drive forth the water with greater force. In some patterns the water is made to pass through many minute holes; but the syringe is also provided with spare nozzles, so as to deliver the water in a greater body; and with elbows, so that the opposite sides of plants in green-houses may be syringed without moving them. Special syringes for the various insecticides are now before the public, and as all are useful in their way it would be invidious to recommend any one in particular. The one sent out by the Stott Company we have found very effective, but in small places we would strongly recommend Cross's syringes as being most economical. See **Engine**.

Syringo'dea. (From *suriggodes*, fistular; in allusion to the slender pier-

anth tube. Nat. ord., *Irideæ*; Tribe, *Sisyrinchieæ*.)

A pretty little greenhouse bulb, requiring the same treatment as *IXIA*.

S. pulchella. Pale purple. S. Africa. 1873. B. M. t. 6072.

Syzygium. (From *suzugos*, coupled; branches and leaves in pairs. Nat. ord., *Myrtaceæ*; Tribe, *Myrteæ*.) See **Eugenia**.

Stove, white-flowered, evergreen shrubs. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a moist bottom-heat; sandy loam and fibry peat. Winter temp., 50° to 60°; summer, 60° to 85°.

S. caryophyllifolium. See *Eugenia caryophyllifolia*.

— *fruticosum*. See *Eugenia fruticosa*.

— *glomeratum*. See *Eugenia glomerata*.

— *inophyllum*. See *Eugenia inophylla*.

— *Jambollanum*. See *Eugenia Jambollana*.

— *obovatum*. See *Eugenia obovata*.

— *paniculatum*. See *Eugenia paniculata*.

— *venosum*. See *Eugenia frondosa*.

— *zeylanicum*. See *Eugenia zeylanica*.

T.

Tabebuia. (From the Brazilian name. Nat. ord., *Bignoniaceæ*.)

Stove trees or shrubs, requiring the same treatment as *TECOMA*. Certain species of *BIGNONIA*, which under that article have been referred to *TABERNÆMONTANA* and *TECOMA*, should be placed in this genus, and are here included as synonyms.

S. œsculifolia. 20. Orange, with yellow spots. June. Mexico. Syns., *Bignonia œsculifolia* and *Tabernæmontana œsculifolia*.

— *chrysantha*. 10. Yellow. Guiana. 1823.

Syns., *Bignonia chrysantha* and *Tecoma chrysantha*.

— *leucostyla*. 12. White or pinkish. West Indies. 1759. Syns., *Bignonia leucostyla* and *B. pallida*.

— *pentaphylla*. 6. Orange. July. East Indies. Syn., *Tecoma pentaphylla*.

— *serratifolia*. 20. Yellow. West Indies. 1822. Syn., *Tecoma serratifolia*.

— *spectabilis*. 10. Purple. West Indies. 1820.

Syns., *Bignonia spectabilis* and *Tecoma spectabilis*. Fl. Ser. t. 948.

Tabernæmontana. (Named after *J. T. Tabernæmontanus*, a celebrated botanist. Nat. ord., *Apocynaceæ*; Tribe, *Plumierieæ*. Allied to *Plumieria*.)

Stove evergreens, all white-flowered, unless otherwise mentioned. Cuttings of half-ripened shoots in the beginning of summer, in sand, under a bell-glass, and in a moist bottom-heat; fibry peat and lumpy loam, with a fair portion of silver sand, and small pieces of charcoal. Winter temp., 55°; summer, 60° to 85°.

T. œsculifolia. The correct name of this is *Tabebuia œsculifolia*.

— *alba*. 10. May. West Indies. 1780. Syn., *T. citrifolia* of Jacquin.

— *Amsonia*. A synonym of *Amsonia Tabernæmontana*.

— *amygdalifolia*. 6. Yellow. July. S. America. 1780. B. R. t. 338.

— *aroudata*. 40. Cream. Peru. 1824.

— *Bartieri*. 6. Western Tropical Africa. B. M. t. 5859.

T. citrifolia. 15. Yellow. Jamaica. 1784.

See also *T. alba*.

— *coronaria*. 5. July. E. Indies. 1770. B. C. t. 406.

— *floré-pléna*. 4. July. W. Indies. 1770.

— *créspa*. 6. July. E. Indies. 1818. Wight. Ic. t. 470.

— *cymosa*. 10. Carthagenia. 1820. Syn., *T. multiflora*.

— *densiflora*. B. R. t. 1273. See *Rauwolfia densiflora*.

— *dichotoma*. 12. September. Ceylon. 1820.

B. R. 1841, t. 53. Syn., *Tanghinia dichotoma*.

— *discolor*. 10. Cream. April. Jamaica. 1822.

— *grandiflora*. 6. Trinidad. 1823.

— *gratissima*. See *T. recurva*.

— *laurifolia*. 13. Yellow. May. W. Indies. 1768. B. R. t. 716.

— *longiflora*. White. Sierra Leone. 1849. B. M. t. 4484.

— *multiflora*. See *T. cymosa*.

— *odorata*. 4. Yellow. October. Cayenne. 1793. Syn., *T. tamaquarina*.

— *persicariifolia*. 6. Cream. Mauritius. 1819. Jacq. Ic. t. 320.

— *recurva*. 6. June. East Indies. 1824. Syn., *T. gratissima*, B. R. t. 1084.

— *tamaquarina*. See *T. odorata*.

— *Wallichiana*. White. India. 1873.

Tacca. (The Malayan name. Nat. ord., *Taccaceæ*.)

Stove, East Indian bulbs, except *artocarpifolia*. Division of the roots in spring; sandy loam and a little fibry peat. Winter temp., 60°; summer, 60° to 90°, and plenty of moisture.

T. artocarpifolia. 6. Green, brown. Madagascar. 1872.

— *aspera*. See *T. integrifolia*.

— *cristata*. 2. Brownish-purple. Summer. Malaya. 1812. B. M. t. 4589. Syn., *Ataccia cristata*, Fl. Ser. tt. 860-1.

— *guineensis*. 2. Guinea. July.

— *integrifolia*. 3. Purple. June. Chittagong. 1810. Herbaceous. B. M. t. 1488.

Syns., *S. aspera* and *Ataccia aspera*.

— *laevis*. 2. Brown. July. 1820.

— *phalifera*. A synonym of *Amorphophallus campanulatus*.

— *pinnatifida*. 2. Purple. 1793. B. C. t. 692.

Tacca'rum. (So named on account of a resemblance to the genus *Tacca*. Nat. ord., *Aroidæ*; Tribe, *Dieffenbachia*.)

Stove, tuberous perennial. For culture, see *STAUROSTIGMA*.

T. peregrinum. See *Lysistigma peregrinum*.

— *Warmingianum*. Spathe olive green, streaked with white, the interior flushed with pink; spadix pink. Winter. 1881. G. C. 1881, xvi. p. 654, fig. 134.

Tachia. (The Guianan name. Nat. ord., *Gentianeæ*; Tribe, *Chironieæ*.)

See **Leianthus**.

Stove, yellow-flowered evergreens, from Jamaica. Cuttings of half-ripened shoots in sand, under a bell-glass, in May; sandy, fibry peat, and a very little loam and leaf-mould. Winter temp., 55°, and kept in a dryish atmosphere; summer, 60° to 80°, and moist.

T. cordifolia. 2. 1816. Syn., *Leianthus cordifolius*.

— *longifolia*. 13. July. 1793. Syn., *Leianthus longifolius*.

— *Swa'tzikii*. 10. July. 1793. Syn., *Leianthus ezertus*.

Tachiade' nus. (From *Tachia*, the name of another genus, and *aden*, a gland; because the ovary is surrounded by a ring of glands as in *Tachia*. Nat. ord., *Gentianeæ*; Tribe, *Ecaceæ*.)

Stove shrub. Cuttings in sand under a hand-glass in heat. Peat, sand, and loam. Keep rather dry in winter.

T. carinata. Purple. October. Madagascar. 1858. B. M. t. 5094.

— *radia'tus*. Wien. Gart. Zeit. 1889, p. 113. Probably synonymous with *T. carinata*.

Tachigalia. (From the Guianese name, *Tachigali*. Nat. ord. *Leguminosæ*; Tribe, *Amherstieæ*. Alliance near the Tamarind.)

Stove, yellow-flowered, evergreen trees. Cuttings of ripened shoots in sand, under a glass, in March, in bottom-heat; also seeds in a hot-bed; sandy, fibry loam. Winter temp., 50° to 55°; summer, 60° to 80°.

T. bijuga. 20. Brazil. 1822.

— *panicula'ta*. 60. Guiana. 1827.

Tacso'nia. (From *tacso*, the name of one of them in Peru. Nat. ord., *Passifloraceæ*; Tribe, *Passiflorææ*.) Sometimes regarded as a section of **Passiflora**, from which it can be readily distinguished by the elongated calyx tube.

Half-hardy evergreen climbers. Cuttings of young shoots any time in summer; fibry loam and a little sandy peat and leaf-mould. Fruit of *T. mollissima* is eatable.

T. adulterina. New Grenada.

— *Andersoni*. Garden hybrid. G. C. 1875, p. 167.

— *Buchanani*. See *Passiflora vitifolia*.

— *eriantha*. See *T. mixta*, var. *eriantha*.

— *exoniensis*. Bright rosy-pink; throat violet. A hybrid between *T. mollissima* and *T. Van-Volzemii*. 1872.

— *igneæ*. See *T. manicata*.

— *insignis*. Crimson. Bolivia. 1873. Flor. Mag. n. s. t. 89. Syn., *Passiflora insignis*. B. M. t. 6069.

— *manicata*. Scarlet. July. Columbia. 1873. Syn., *Passiflora manicata*. B. M. t. 6129.

— *mixta*. Pink. August. Andes.

— *eriantha*. Pink. Plant covered with white pubescence. Syn., *T. eriantha*. B. M. t. 5750.

— *quite'nsis*. Rose-pink. July. Peru. 1867. Syn., *T. quitensis*, var. *eriantha*.

— *speciosa*. Rosy-red. Stem glabrous. Columbia. 1871. Syn., *T. speciosa*.

— *mollissima*. 20. Rose. September. Quito. 1844.

— *Parrictæ*. Rosy and rich orange. Tolima. 1882. G. C. 1882, xvii., p. 225.

— *peduncularis*. 10. Rose. Peru. 1815.

— *pinnatistipula*. 30. Pale rose. September. Chili. 1828. B. R. t. 1536. Syn., *Passiflora pinnatistipula*.

— *quadridentata*. } See *Passiflora quadri-*
— *quadriglandulosa*. } *glandulosa*.

— *quite'nsis*. Rosy. Peru. 1869.

— *eriantha*. See *T. mixta*, var. *quitensis*.

— *sanguinea*. Crimson. July. Trinidad. 1852.

— *speciosa*. See *T. mixta*, var. *speciosa*.

— *Smythiana*. Garden hybrid. 1892.

— *tomentosa*. Rosy-red. Columbia. 1870.

— *Van-Volzemii*. Crimson. New Grenada. 1866. B. M. t. 5571. One of the finest.

Tænio'psis. (From *tainia*, a fillet, and *opsis*, like; the resemblance of the leaf, or frond. Nat. ord., *Filices*.) See **Vittaria**.

Stove, brown-spored ferns. See **FERNs**.

T. lineata. See *Vittaria lineata*.

— *revoluta*. See *Vittaria revoluta*.

Tæni'tis. (From *tainia*, a fillet; the resemblance of the fronds, or leaves. Nat. ord., *Filices*.)

Stove, brown-spored ferns. See **FERNs**.

T. angustifolia. $\frac{1}{2}$. July. Jamaica. 1816.

— *blechnoides*. May. India.

— *interrupta*. Sori not continuous.

— *chinensis*. June. China. 1828.

— *furcata*. June. Trinidad. 1824.

— *graminifolia*. $\frac{1}{2}$. July. Trinidad. 1820.

— *lancoleta*. 1. August. W. Indies. 1818.

Tagetes. (Named after a Tuscan divinity. Nat. ord., *Compositæ*; Tribe, *Helenioideæ*.)

Yellow-flowered, Mexican annuals, except where otherwise mentioned. Annuals, sown in open ground in May; or better still, in a hotbed in the beginning of April, and planted out in the middle of May. Perennials, by seed, division, and cuttings. *T. lucida* is pretty either for a cool greenhouse or a bed on the lawn in summer.

T. angustifolia. 3. August. 1826.

— *caracasana*. 3. August. Caraccas. 1819.

— *clandestina*. 3. July. 1823.

— *corymbosa*. Swt. Fl. Gard. t. 151. See *T. patula*.

— *daucoi'des*. June.

— *ere'cta*. 3. July. 1596. African Marigold.

— *filifolia*. 3. August. 1826.

— *florida*. 1. August. 1827. Herbaceous.

Swt. Fl. Gard. ser. 2, t. 35.

— *gigantea*. 6-9. Bolivia. 1886.

— *glandulifera*. 6. October. 1826.

— *glandulosa*. 3. September. S. America. 1819.

— *lucida*. 1. August. S. America. 1798.

Herbaceous. B. M. t. 740.

— *micrantha*. 3. August. 1822.

— *minuta*. 2. August. Chili. 1728.

— *patula*. 2. August. 1573. B. M. t. 160.

Syn., *T. corymbosa*. B. M. t. 3830.

French Marigold.

— *lutea*. $1\frac{1}{2}$. August. 1825.

— *signata*. $1\frac{1}{2}$. Yellow. Mexico.

— *subvillosa*. 2. September. 1823.

— *tenuifolia*. 3. August. Peru. 1797. B. M. t. 2045.

Tail Flower. *Anthurium*.

Tainia. (From *tainia*, a band; in allusion to the shape of the lip. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Bletieæ*. Syn., *Ania*.)

Stove orchids. For culture, see **CALANTHE**.

T. bicornis. Green, reddish; lip yellow, blotched with red. March. Ceylon. 1842. Syn.,

Ania bicornis. B. R. 1844, t. 8.

— *latifolia*. 2. Green, brown. April. Sylhet.

1852. Syn., *Calanthe viridifusca*. B. M. t. 4669.

Talau'ma. (Its South American name. Nat. ord., *Magnoliaceæ*; Tribe, *Magnolieæ*.)

Stove evergreens. Cuttings of ripe shoots, thinly, in sand, under a large bell-glass, in heat;

grafting and inarching on *Magnolia obovata*; fibry peat and a little loam and sand. Winter temp., 45° to 55°; summer, 60° to 80°

T. Cando'llii. 15. Cream-colour. April. Java. 1827. B. M. t. 4251. Syn., *Magnolia odoratissima*.

— *Galeottiana*. Dull yellow. B. M. t. 6614.

— *Hodgeoni*. Creamy-white. Winter. Himalayas. 1857.

— *Plumieri*. 60. White. Antilles. 1829.

— *pu'nta*. 3. Cream. Java. 1786. Syn., *Magnolia pumila*. Andr. Rep. t. 226.

Talewort. *Bora'go officinalis*.

Talie'ra. (The Indian name. Nat. ord., *Palmeæ*; Tribe, *Corypheeæ*.) See **Corypha**.

Stove palm. Seeds; rich, turfy loam. Winter temp., 50° to 60°; summer, 60° to 90°.

T. bengale'nsis. See *Corypha Tali'era*.

Taliga'lea. (From the Guianese name. Nat. ord., *Verbenaceæ*.) A synonym of **Amasonia**.

Stove sub-shrubs.

T. campestris. A synonym of *Amasonia campestris*.

— *puni'cea*. A synonym of *Amasonia calycina*. B. M. t. 6916.

Talbotia. See **Vellozia**.

Tali'num. (From *thalia*, a green branch; its durable verdure. Nat. ord., *Portulacææ*.)

Annuals and biennials, sown in a hotbed early in spring, pricked out, and bloomed in the greenhouse, or a sheltered place out of doors; the others are under-shrubs, easily propagated by cuttings of the succulent shoots, dried at the base before inserting them in sandy soil; peat, loam, sand, and brick-rubbish. Winter temp., 45° to 58°, and dryish; summer, 60° to 80°.

ANNUALS, ETC.

T. purpureum. Purple. August. Mexico. 1826.

— *reflexum*. 1. Yellow. September. S. America. 1800. Biennial. B. M. t. 1543.

EVERGREENS, ETC.

T. Arno'tii. 1½. Yellow. S. Africa. 1867.

— *crassifolium*. 1. Red. August. 1800.

— *albiflorum*. White. July. S. America. 1819.

— *cuneifolium*. 1. Purple. August. Egypt. 1820.

— *pa'tens*. 1. Red. September. S. America. 1776. Herbaceous. Andr. Rep. t. 253.

— *teretifolium*. 1. Pink. August. N. America. 1823. Herbaceous. B. R. 1843. t. 1.

— *triangularis*. ¾. Yellow. August. W. Indies. 1739.

EXCLUDED SPECIES.

T. Anacampseros = *Anacampseros Telephiatrum*.

— *Andre'wsii* = *Calandrinia Andrewsii*.

— *ciliatum* = *Calandrinia ciliata*.

— *paniculatum* = *Calandrinia paniculata*.

— *pa'tens* = *Calandrinia Andrewsii*.

— *polyandra*, B. M. t. 4833, = *Calandrinia polyandra*.

Talipot Palm. *Cory'pha umbraculifera*.

Tali'sia. (From *Toulichis*, the name in Guiana. Nat. ord., *Sapindacææ*; Tribe, *Sapindeæ*.)

Stove evergreen shrubs. Cuttings of ripened wood, with leaves, thinly inserted in sand, under

a glass, in moist bottom-heat; sandy peat and fibry loam. Winter temp., 50° to 60°; summer, 60° to 85°.

T. gusané'nsis. 8. Rose. Guiana. 1824. Syn., *T. rosea*.

— *princeps*. Whitish. Leaves pinnate, six feet long. Venezuela. Syns., *Brounea erecta*, *B. princeps*, and *Theophrasta pinnata*.

Tallow Shrub. *My'rica cerifera*.

Tallow Tree, Chinese. *Stil'lingia sebifera*.

Tallow Tree, Sierra Leone. *Pentadé'sma butyro'cea*.

Tamarind Tree. *Tamari'ndus indica*.

Tamari'ndus. Tamarind-tree. (From *Tamarlindy*, the Arabic name. Nat. ord., *Leguminosæ*; Tribe, *Amherstiacæ*.)

Stove, yellow-flowered, evergreen trees. Seeds soaked, and sown in a hotbed; cuttings in sand, in heat; sandy loam and leaf-mould. Winter temp., 50° to 60°; summer, 60° to 85°.

T. indica. 60. July. Tropics. 1633. Lem. Jard. Fl. t. 133. Syns., *T. occidentalis* and *T. officinalis*.

— *occidentalis*. See *T. indica*.

— *officinalis*. B. M. t. 4563. See *T. indica*.

Ta'marix. Tamarisk. (From *Tamaris*, now *Tambro*, the name of a river where it grows, on the borders of the Pyrenees. Nat. ord., *Tamariscineæ*; Tribe, *Tamariscææ*.)

Hardy, by cuttings under a hand-light, or even in the open air, in spring or autumn, and in any common soil; the tender species require a warm greenhouse or a cool plant-stove, and to be grown in peat and loam; increased by cuttings under a hand-glass, in sand, and in heat.

HARDY EVERGREENS.

T. davurica. A synonym of *Myricaria davurica*.

— *gallica*. 10. Flesh. July. England. Deciduous. Sibth. Fl. Gr. t. 291.

— *germanica*. A synonym of *Myricaria germanica*.

— *odessa'na*. Odessa. 1891.

— *Pallasii*. 8. Flame. July. Caucasus. 1827.

— *parviflora*. Pink. Summer. Levant. Syns., *T. africana* and *T. tetrandra* of some authors. Fl. Ser. t. 898.

— *tetrandra*. 6. White. July. Tauria. 1821. See also *T. parviflora*.

STOVE AND GREENHOUSE EVERGREENS.

T. articulata. 10. Pink. Arabia, Persia, and India. Syn., *T. orientalis*. Greenhouse.

— *dic'ca*. 6. East Indies. 1823.

— *indica*. 6. Pink. July. East Indies.

— *orientalis*. See *T. articulata*.

Tamone'a. (From *tamone*, the Guianan name. Nat. ord., *Verbenaceæ*; Tribe, *Verbeneæ*. Allied to *Lantana*.)

Tender, blue-flowered biennials. By seed in a hotbed in spring; pricked out, and potted off, and blossomed in the greenhouse.

T. Curassavica. 1. July. W. Indies. 1823. Syn., *T. verbenacea*.

— *mutica*. 1. July. Guiana. 1820.

— *spicata*. September. Trinidad. 1824.

— *verbenacea*. See *T. Curassavica*.

Ta'mus. (A name used by Pliny. Nat. ord., *Dioscoreacææ*.)

Hardy perennial twiner, whose leaves turn a beautiful bronze in autumn. Ordinary garden-soil. Seeds, or division of roots.

T. commutata. 10. Greenish; fruit bright scarlet. May to June. England. Eng. Bot. ed. 3, t. 1508. Black Bryony; Lady's Seal; Murrain Berries.
— *elephantipes*. B. M. t. 1347. See *Testudinaria elephantipes*.

Tan. See **Bark.**

Tanacetum. Tansy. (Derivation uncertain. Nat. ord., *Compositæ*; Tribe, *Anthemideæ*.)

Hardy herbaceous perennials. Divisions in spring, and cuttings under a hand-light in summer; any soil. *T. grandiflorum* requires a cool greenhouse or a cold pit in winter, and a sandy, fibry loam.

T. Balsamita. 2-3. Yellow. Autumn. Orient. Syn., *Balsamita vulgaris*.
— *elegantis*. See *T. huronense*.
— *flabelliforme*. B. M. t. 212. See *Pentzia flabelliformis*.
— *fruticosum bracteatum*. Yellowish. India. 1877.
— *grandiflorum*. 1½. Yellow. June. Cape of Good Hope. 1820.
— *huronense*. Yellow. July. California. 1857. Syn., *T. elegantis*. Fl. Ser. t. 1191.
— *leucophyllum*. ¾. Golden-yellow. Summer. Turkestan. Gh. t. 1064.
— *purpureum*. 1½. Pale red. June. Nepal. 1811.
— *vulgaris*. 2. Yellow. June. Britain. Eng. Bot. ed. 3, t. 716.
— — *variegatum*. 2. Yellow. July. Britain.

Tanghinia. (From *Tanghin*, the Madagascar name. Nat. ord., *Apocynaceæ*.) See **Cerbera**.

Stove, white-flowered evergreens, from the East Indies. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat; peat and loam, with a little sand. Winter temp., 50° to 60°; summer, 60° to 90°. The nut of *veneniflua*, though not larger than an almond, is sufficient to poison a score of people.

T. dichotoma. See *Tabernaemontana dichotoma*.
— *laurifolia*. See *Cerbera laurifolia*.
— *Manghas*. Kn. and West. t. 78. See *Cerbera Manghas*.
— *Odollam*. Wight. Ic. t. 441. See *Cerbera Odollam*.
— *veneniflua*. Kn. and West. t. 67. See *Cerbera veneniflua*.

Tangier Pea. *Lathyrus tingitana*.

Tanner's Tree. *Cordia myrsinifolia*.

Tansy. *Tanacetum vulgare*.

Tape Grass. *Vallisneria spiralis*.

Tapeinanthus. (From *tapeinos*, low, and *anthos*, flower; a plant of dwarf habit. Nat. ord., *Amaryllidææ*.)

The only species of this genus is a hardy bulb, difficult of cultivation in this country.

T. humilis. ¾. Yellow. Spain and Tangiers. 1837.

Tapeinotes. (From *tapeinotes*, lowliness; very dwarf. Nat. ord., *Ges-*

neraceæ; Tribe, *Gesneraceæ*.) See **Sinningia**.

Stove plant. For cultivation, see **NEMATANTHUS**.

T. Carolinæ. B. M. t. 5623. See *Sinningia barbata*.

Tapogomea. (From the Guianese name, *tapogoma*. Nat. ord., *Rubiaceæ*; Tribe, *Psychotriaceæ*.) See **Cephaelis**.

T. purpurea. See *Cephaelis purpurea*.

— *violacea*. See *Cephaelis violacea*.

Taraxacum. (From *tarasso*, to alter; its supposed medicinal effect. Nat. ord., *Compositæ*; Tribe, *Cichoraceæ*.)

Hardy, perennial herbs, almost stemless. Ordinary garden-soil. Propagated by divisions. Although they will produce seeds readily, they should never be allowed to do so, as they spread with great rapidity, and on account of the depth to which the tap-roots descend are difficult to eradicate. *T. officinale* is grown as a salad plant; its roots are also dried and used as a kind of coffee.

T. montanum. Yellow. August. Armenia. 1834. Syn., *Lasiopus sonchoides*, Swt. Fl. Gard. ser. 2, t. 346.

— *officinale*. Yellow. March to October. Britain. Eng. Bot. ed. 3, t. 802. Common Dandelion.

Tarchonanthus. African Fleabane. (From *tarchon*, Arabic for tarragon, and *anthos*, a flower. Nat. ord., *Compositæ*; Tribe, *Inuloidææ*.)

Greenhouse, purple-flowered evergreens, from South Africa. Cuttings in sand, under a bell-glass, in the beginning of summer; fibry, sandy loam and a little leaf-mould. Winter temp., 40° to 48°.

T. camphoratus. 10. 1690. B. C. t. 382.

— *dentata*. A synonym of *Brachylaena nervifolia*.

— *ellipticus*. A synonym of *Brachylaena elliptica*.

Taro. *Colocasia antiquorum*. This plant forms one of the chief articles of diet in the Pacific Isles, where it is largely cultivated. The tubers are boiled or baked, or made into puddings or bread, and the young leaves may be eaten like Spinach; but, like the tubers, they require to be well cooked to destroy their poisonous properties and acidity. Several varieties are cultivated, some being better for one mode of cooking, some for another. Dr. Seemann relates that one kind, called "Kurilagi," was pointed out to him as having been eaten with nearly a whole tribe of people, in the island of Viti Levu. This tribe, having given great offence to the ruling chief of the district, was condemned to die. Every year the inmates of one house were baked and eaten, the empty dwelling burnt down, and its foundation planted with "Kurilagi." The next year, when this Taro was ripe, it was the signal for destroying the next house

and its inhabitants, and the planting of a fresh field of Taro. After many years the remaining few were pardoned, and allowed to die a natural death, and in 1860 one old woman was the only survivor of the tribe. See Seemann's "Flora Vitiensis."

Tarragon. (*Artemisia dracunculoides*). Used in salads to correct the coldness of the other herbs; and its leaves are excellent when pickled.

Soil.—Poor, dry soil is essential to produce it in perfection, and hardy.

Propagated by parting the roots. To have green Tarragon during the winter and spring, strong-rooted plants must be planted, small portions at a time, once or twice a month, from the close of October, to the end of January. For the main crop, it may be planted any time from the end of February until the end of May.

Plant ten inches apart, and, if dry weather, water must be given regularly every evening until the plants are rooted. They soon establish themselves, and may be gathered from the same year. As they run up, the stems should be cut down, which causes them to shoot afresh.

At the end of autumn, if some established plants are set beneath a south fence, they will often afford leaves throughout the winter, or, at all events, come early in the spring. Some of the leaves should be gathered in the summer, and dried for winter's use.

Tasma'nnia. (Named after C. Tasmann, a Dutch navigator. Nat. ord., *Magnoliaceae*; Tribe, *Winteraceae*. Allied to *Illicium*.)

The fruit of *T. aromatica* is used for pepper in Australia. Greenhouse, Australian, white-flowered evergreens. Cuttings of firm shoots in sand, under a bell-glass; kept cool at first, and then, when the base swells, placed in a sweet, mild bottom-heat. Fibry, sandy loam, with a little peat; require the protection of a cold pit in winter.

T. aromatica. B. R. 1845, t. 43. See *Drimys aromatica*.

Tasteless Mountain Currant. *Ribes alpinum*.

Tausche'ria. (In honour of Ignatius F. Vauscher, once Professor of Botany at Prague. Nat. ord., *Cruciferae*; Tribe, *Isatideae*.)

Hardy annual, of little horticultural value. *T. lasiocarpa*. Yellow. Central Asia.

Tavernie'ra. (After J. B. Tavernier, a traveller in the Levant, in the seventeenth century. Nat. ord., *Leguminosae*; Tribe, *Hedysareae*.)

Greenhouse undershrubs.

T. lappa'cea. Yellow. July. Arabia Felix. 1820.

— *nummularia*. 1-2. Red. June. India, 1826. East Indian Moneywort.

Taxa'nthema. (From *taxis*, arrangement, and *antheon*, a flower. Nat. ord., *Plumbaginaceae*; Tribe, *Staticeae*.) A synonym of **Statice**.

T. austr'alis. See *Statice australis*.

— *inca'na*. Swt. Fl. Gard. t. 272. See *Statice*

— *speciosa*. Swt. Fl. Gard. t. 105. See *Statice*

— *speciosa*.

— *tata'rica*. Swt. Fl. Gard. t. 37. See *Statice tatarica*.

Taxo'dium. Deciduous Cypress. (From *taxus*, the yew, and *oides*, like. Nat. ord., *Coniferae*; Tribe, *Taxodiaceae*. Syn. *Glyptostrobus*.)

Hardy or half-hardy Conifers. Seeds in April; cuttings in autumn or spring, in a moist, shady place; layers, also, root the first season; a low, moist situation suits all the hardy varieties best; cuttings will also strike in water as freely as the Nerium. The plants should have a little peat added, and will require a little protection in winter, such as a cold pit would give, or surrounding them with a frame of Spruce-branches.

T. cape'nsis. See *Widdringtonia juniperoides*.

— *distichum*. 50. May. N. Amer. 1640.

— *denu'datum*. Syn., *T. denudatum*.

— *exce'lsum*. See *T. mucronatum*.

— *fastigia'tum*. Florida.

distichum, var. *exce'lsum* and var. *mexi-*

canum, and *T. mexicanum*.

— *pe'ndulum*. See *T. distichum*, var. *micro-*

phyllum.

— *sine'nsis*. See *T. distichum*, var. *sinense*.

Taxus. The Yew. (From *taxon*, a bow; being used for bows. Nat. ord., *Coniferae*; Tribe, *Taxaceae*.)

Evergreen Conifers. Seed, gathered in October, either sown directly, or taken to the rot-heap until spring, when the plants, many of them, will appear the following year; cuttings, ten inches in length, lower half deprived of leaves, in sand, in a shady border, in April and August, taken off with a heel; deep, loamy soil, with a fair portion of moisture.

T. adpre'ssa. See *T. baccata*, var. *adpressa*.

— *bacca'ta*. 10-50. March. Britain. Common

Yew. There are numerous varieties,

such as:—

— *adpre'ssa*. S. Japan. 1844. Syn., *T.*

adpressa, *T. tardiva*, and *Cephalotaxus*

tardiva. Forms of this are:—*erecta*,

stricta, and *variegata*.

— *argentea*. Leaves silvery striped.

— *Barro'ni*. See *T. baccata*, var. *variegata*.

- T. baccata cheshuntensis*.
 — *Dovastoni*. Branchlets drooping.
 — *variegata*. Leaves edged with golden-yellow when young, with silvery-white when old.
 — *Elvastonensis*. Young leaves bright orange.
 — *epacrisoides*. Dwarf. Leaves light green.
 — *ereceta*. Fulham Yew; Upright Common Yew. There is a form *Crowderi*.
 — *ericoides*. 1-2. Leaves small, dark green.
 — *fastigiata*. 20. April. Ireland. 1780. Irish or Florence Court Yew.
 — *au-reo-variegata*. Golden-variegated form.
 — *variegata*. Silvery-white or straw-coloured variegated form.
 — *Foxtii*. 2. Leaves dark green.
 — *fructu-luteo* is a handsome yellow-berried variety.
 — *glauca*. Leaves bluish or greyish beneath.
 — *Jacksoni*. Leaves light green. Branches pendulous.
 — *naana*. 2. Leaves dark, glossy green.
 — *niopathensis*. A variety of columnar habit.
 — *procumbens*. 8. February. Europe.
 — *recurvata*. Margins of leaves involute.
 — *sparsifolia*. March. Branches spreading.
 — *variegata*. Leaves edged with golden-yellow. *Barroni* is a freely fruiting form of this.
 — *Wallichiana*. See *T. Wallichiana*.
 — *brevifolia*. 40. California. Syn., *T. Lindleyana*. Western or California Yew.
 — *canadensis*. 4. North America. 1800. American Yew; Ground Hemlock.
 — *variegata*. Leaves variegated with white.
 — *cuspidata*. 20. Japan.
 — *empetrifolia*. See *T. baccata*, var. *ericoides*.
 — *Fortunei*. See *Cephalotaxus Fortunei*.
 — *globosa*. Mexico. Mexican Yew.
 — *Harringtonii*. See *Cephalotaxus pedunculata*.
 — *Inukaja*. See *Cephalotaxus pedunculata*.
 — *Lindleyana*. See *T. brevifolia*.
 — *Makoya*. See *Podocarpus chinensis*.
 — *nucifera*. See *Torreya nucifera*.
 — *taraii*. See *T. baccata*, var. *adpressa*.
 — *Wallichiana*. Nepaul. Syn., *T. baccata*, var. *Wallichiana*.

Tea. The dried leaves of *Came'llia theifera*.

Tea Berry or Canada Tea. *Qualthe'ria procumbens*.

Tea, Botany Bay. *Smit'ia glycyphylla*.

Tea, Paraguay. *Ilex paraguariensis*.

Tea Tree. *Ly'cium ba'rbarum*.

Teak Tree, African. *Oldfie'ldia africa'na*.

Teak Tree, Indian. *Te'ctona gr'andis*.

Teak Tree, New Zealand. *Vitex littoralis*.

Teasel, Teazel, or Teazle. *Dipsac'us*.

Te'coma. (A contraction of the Mexican name, *Tecomacochili*. Nat. ord., *Bignoniaceae*; Tribe, *Tecomae*.)

Mostly by cuttings; the hardy *radicans* and its varieties by cuttings of the shoots, and very freely by pieces of the roots; all the others are the better for a glass being placed over them, and flourish in loam and peat. The *capensis* makes a neat pot-plant. Under the article *BIGNONIA* several species have been referred to this genus, which should have been placed in *TABEBUIA*.

HARDY EVERGREEN CLIMBERS.

- T. radicans*. 30. Orange. July. N. America. 1640. Syn., *Bignonia radicans*, B. M. t. 485.
 — *major*. 30. Orange. July. N. America. 1640.
 — *minor*. 20. Scarlet. July. N. America. 1640.

GREENHOUSE EVERGREEN CLIMBERS, ETC.

- T. australis*. Orange. June. N. S. Wales. 1793. Syn., *T. diversifolia*, *Bignonia meonantha* and *B. Pandorea*.
 — *capensis*. 8. Orange. August. Cape of Good Hope. 1823. B. R. t. 1117.
 — *diversifolia*. See *T. australis*.
 — *grandiflora*. 30. Orange. July. China. 1800. Deciduous. Syn., *Bignonia chinensis* and *B. grandiflora*.
 — *jasmifolia*. Pink. August. N. S. Wales. Syn., *Bignonia jasmifolia*.
 — *Mackeei*. See *T. Ricasoliana*.
 — *meonantha*. 12. Blush. April. Australia. 1815.
 — *molle*. 6. Yellow. Mexico. 1824. Deciduous.
 — *Ricasoliana*. Rose-pink, with darker veins. South Africa. 1887. Bull. Soc. Tosc. 1887, xviii. p. 17, t. 1-2. Syn., *T. Mackeei*.
 — *Smit'ia*. Garden hybrid between *T. velutina* and *T. capensis*, raised in South Australia.

STOVE EVERGREEN SHRUBS.

- T. amboinensis*. Orange-red. Amboina. Climber.
 — *au'stro-caledonia*. White. New Caledonia. Syn., *Pandorea austro-caledonica*.
 — *chilensis*. Scarlet. Spring. Chili. 1870. Syn., *Campsidium chilense*.

 — *undulata*. Orange. Summer. India. Syn., *Bignonia undulata*.
 — *valdiviana*. Orange. Spring. Chili. 1870. Syn., *T. mirabilis*.
 — *xylocarpa*. See *Stereospermum xylocarpum*.

Tecophilæa. (Named after *Tecophila*, a daughter of Bertero. Nat. ord., *Hæmodoraceæ*; Tribe, *Conanthe-reæ*.)

Greenhouse bulbs. Seeds; offsets. Rich sandy loam; the bulbs should be kept dry during their period of rest. Summer temp., 60° to 86°; winter, 45° to 55°. This genus is remarkable for its half-inferior ovary, which peculiarity renders its position somewhat doubtful, being in this respect exactly intermediate between the *Amaryllidaceæ*, which are characterized by their inferior ovary, and the *Liliaceæ*, which have a superior ovary.

T. cyanocrocus. Blue; throat whitish. Juan Fernandez. 1872.
— — *Leichtlinii.* Deep blue. 1882. Syn., *T. Leichtlinii.*
— — *Regei.* Blue. Perianth segments narrower than in the type. Syn., *T. cyanocrocus* of Gf. t. 718.

Te'ctona. Teak-tree. (The Malabar name is *tekka*. Nat. ord., *Verbenaceæ*; Tribe, *Viticeæ*.)

For ship-building this gives the best timber. Stove evergreen tree. Cuttings of ripened shoots in sand, under a bell-glass, in April, and in a moist bottom-heat; sandy loam and fibry peat. Winter temp., 50° to 55°; summer, 60° to 85°. *T. grandis.* 100. White. E. Indies. 1777.

Teedia. (Named after J. G. Teede, a German botanist and traveller. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*. Alliance near to *Phygellus*.)

Greenhouse, purple-flowered biennials, from South Africa. Seeds in a slight hotbed in March; cuttings of side-shoots, taken off in April or August, and inserted in sandy soil, under a hand-light; sandy loam and vegetable mould.

T. lucida. 2. April. 1774. B. R. t. 209.
— *pubescens.* 2. May. 1816. B. R. t. 214.

Teesdalia. (Named after R. Teesdale, author of a Flora of Castle Howard. Nat. ord., *Cruciferaæ*; Tribe, *Thlasvideæ*. Allied to Candytuft.)

Hardy, white-flowered annuals. Seeds; common soil.

T. Iberis. See *T. nudicaulis*.
— *Lepidium.* †. March. South Europe. 1824.
— *nudicaulis.* †. May. Britain. Syn. *T. Iberis*. Pepper Cress.

Tela'nthera. (From *teleois*, complete, and *anthera*, an anther. Nat. ord., *Amarantaceæ*; Tribe, *Gomphreneæ*.)

Half-hardy herbaceous plants, chiefly used for carpet bedding. Divisions and cuttings. To obtain the latter, trim back old plants about March, and plunge in a hotbed, when they soon produce cuttings, which will root freely in leaf-mould and sand in heat; box off in rich light soil and keep in heat until well established, then gradually shift them to houses of lower temperature, so as to be ready for bedding out. They are cultivated under the name of ALTERNANTHERA.

T. amœna. Leaves variegated with rose, brown, and green. Brazil. 1865.
— — *ambilis.* Leaves green, red, and rose. Brazil. 1868.
— — *tricolor.* Leaves dark green, variegated with rose, purple, and orange-yellow. Brazil. 1862.

T. Bettziehiana. Leaves olive and red. Brazil. 1862.

— — *spathulata.* Stem and leaves red. Brazil. 1865.

— *cane-scens.* 1. White. July. Cumana. 1825. Syn., *Alternanthera canescens*.

— *caracasana.* 1. White. July. Caraccas. 1819. Syn., *Alternanthera caracasana*.

— *ficolor.* Leaves variegated with green, rose, and red. India. 1865. Useful as a bedding plant.

— *polygonoïdes.* 1. White. July. S. America. 1731. Syn., *Alternanthera polygonoïdes*.
— *versicolor.* Leaves rose, green, and dark blood-red. Brazil. 1865.

Telegraph-Plant. *Desmodium gy-rans.*

Tele'kia. (Name not explained. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*.) A synonym of *Bupthalmum*.

Hardy herbaceous. Seeds, and divisions of the root in spring; common soil.

T. speciosa. B. M. t. 3466. See *Bupthalmum cordifolium*.

Telfairia. (Named in honour of Mrs. Telfair. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumerineæ*.)

Stove twiners. Cuttings of the flowering shoots, if procurable; if not, other young shoots, getting firm, in sand, and in heat; peat and loam. Summer temp., 60° to 85°; winter, 50° to 58°.

T. occidentalis. White, purple. Autumn. W. Tropical Africa. 1870. B. M. t. 6272.

— *pedata.* 20. Pink. July. Zanzibar. 1825. B. M. t. 2751-2. Syns., *Fevillea pedata*, B. M. t. 2681, and *Joliffia africana*.

Telip'ogon. (From *telos*, the summit, and *pogon*, a beard; the column is bearded to its summit. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Notylieæ*. Allied to *Acropis*.)

Stove epiphytal orchid. Should be grown on blocks. See ORCHIDS.

T. Croesus. Yellow, with dark network. Columbia. 1877.

Te'llima. (An anagram of *Mitella*; separated from the genus *Mitella*. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifrageæ*.)

Hardy herbaceous. Division; sandy loam and peat.

T. grandiflora. 1. Pink. April. North West America. 1826. B. E. t. 1178.

Telo'pea. Warratah. (From *telo-pas*, seen at a distance; conspicuous flowers. Nat. ord., *Proteaceæ*; Tribe, *Embothriæ*.)

This is the finest of all the *Proteaceæ*. Greenhouse evergreen. Cuttings of ripe shoots with leaves on, except the one at the base, in sand, under a glass, and kept cool until the base swells, when a little heat may be given; also by layering the suckers that rise from the roots; sandy loam and peat, with a third of broken stone, potsherds, and charcoal, and the pot extra well drained. Winter temp., 45° to 55°, and not much water; summer, 60° to 75°, and a good supply of moisture, the pot being defended from the sun.

T. speciosissima. 10. Scarlet. June. N. S. Wales. 1789. Syn., *Embothrium spathulatum*, B. M. t. 1128, and *E. speciosum*.

Temasia *Woeberana*. See **Py-rus**.

Temperature is one of the most important circumstances connected with the cultivation of plants; for upon its proper regulation and just accommodation to the intensity of light depend, in the chief degree, whether a plant is healthy, and capable of performing its functions. Every seed has its appropriate temperature for germinating (see **Germination**); every root has a temperature in which it imbibes food most favourably (see **Bottom-heat**); and every leaf has a temperature in which it respire most vigorously. (See **Leaves** and **Night Temperature**.)

Temples dedicated to some deity of the heathen mythology, as to Pan in a grove, or to Flora among bright, sunny parterres, are not inappropriate, if the extent of the grounds and the expenditure on their management allow them to be of that size and of that correctness of style, which give the classic air and dignity that are their only sources of pleasure.

Templeto'nia. (Named after *J. Templeton*, an Irish botanist. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*. Allied to *Boissiaea*.)

Greenhouse, red-flowered evergreens, from Australia. Cuttings of half-ripened wood in sand, under a bell-glass; fibry peat and sandy loam, most of the first, with a little charcoal. Winter temp., 40° to 48°.

T. glauca. B. M. t. 2088. See *T. retusa*.
— *retusa*. 2. May. 1803. B. M. t. 2334. Syn., *T. glauca*.

Te'naris. (Probably derived from the South African name. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdeniææ*.)

Greenhouse, perennial herbs. For culture, see **CEROPEGIA**.

T. rostrata. 1½. Whitish, with minute purple dots. East Tropical Africa. 1885.

Teno'ria. (After *Prof. Tenore*, of Naples. Nat. ord., *Umbelliferae*; Tribe, *Ammineæ*.) A synonym of **Bupleurum**.

T. arbore'scens. See *Heteromorpha arbore'scens*.
— *canad'e'nsis*. See *Crithmum latifolium*.
— *cori'cea*. See *Bupleurum gibraltarium*.
— *frut'scens*. See *Bupleurum frutescens*.
— *frutico'sum*. See *Bupleurum fruticosum*.
— *plantagi'neum*. See *Bupleurum plantagineum*.

Tentaculate, furnished with thread-like appendages.

Tepals. A name used by Prof. H. G. Reichenbach to designate the inner perianth segments, or petals, of Orchids.

Tephro'sia. (From *tephros*, ash-grey; colour of some of the species.

Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*. Allied to *Galega*.)

Seeds, steeped in water at 130° for a day before sowing in a hotbed; cuttings of young, stubby side-shoots in sand, under a bell-glass, in May, the stove species in a hotbed; sandy, fibry loam and peat. Greenhouse or stove temperatures.

GREENHOUSE EVERGREENS, ETC.

T. cape'nsis. 1. Purple. July. Cape of Good Hope. 1825.

Terpna'nthus. (From *terpnos*, delightful, and *anthos*, flower. Nat. ord., *Rutaceæ*; Tribe, *Cuspariææ.*) See **Spiranthera.**

T. jasmino'des. A synonym of *Spiranthera odoratissima.*

Terraces are not permissible anywhere but around the mansion, and they are noble and effective almost in proportion to their breadth.

Testace'la halio'ti'dea. The Ear-shelled Slug is a slug that the gardener should make himself well acquainted with, and not only that, but should endeavour to get his garden well stocked with them; for, unlike other slugs, this one is a real friend to the gardener, since it does not feed upon vegetable matter at all, but is strictly carnivorous, feeding principally upon worms and other species of slugs, of which it destroys considerable quanti-

ties. It should, therefore, never be killed. This slug is readily recognized by its yellow colour, and the small ear-shaped external shell it carries upon its tail: no other British slug has an external shell. It is nocturnal in its habits, and has the power of burrowing to a considerable depth in the ground. See the *Gardeners' Chronicle* for 1877.

Testudina'ria. Elephant's Foot. (From *testudo*, a tortoise; the hard, outside covering of the corm, or root. Nat. ord., *Dioscoreaceæ.*)

Greenhouse, yellow-flowered deciduous climber, from South Africa. Cuttings of firm side-shoots, or cuttings of the young shoots when growth commences, in spring, in sandy loam, under a bell-glass, and care taken to prevent damping; might be tried by cuttings of the roots; sandy, fibry loam and turfy peat. Winter temp., 43° to 48°, and kept rather dry.

- T. elepha'ntipes.* 8. July. 1774. B. R. t. 921. Syn., *Tamus elephantipes.* B. M. t. 1347.
 — *monta'na.* 8. July. 1816.

Tetra'cera. (From *tetras*, four-fold, and *keras*, a horn; the four capsules, or divisions of seed-pod, recurved. Nat. ord., *Dilleniaceæ*; Tribe, *Delimeæ.* Allied to *Delima.*)

Stove, yellow-flowered, evergreen climbers. Cuttings of young shoots, getting firm, in sand, under a bell-glass, thinly, and in bottom-heat; sandy loam and fibry peat. Winter temp., 55°; summer, 65° to 85°.

- T. alnifolia.* 20. Guinea. 1798.
 — *Caline'a.* A synonym of *Dolichoarpus Caline'a.*
 — *obova'ta.* February. Guinea. 1822.
 — *potato'ria.* 20. Sierra Leone. 1822.
 — *vohu'bilis.* 12. S. America. 1818.

Tetra'dium. (From *tetradeion*, a quaternion; and the parts of the flowers are arranged in fours. Nat. ord., *Rutaceæ*; Tribe, *Zanthoxyloæ.*) Now united with **Evodia.**

- Stove, evergreen tree.
T. tricho'tomum. 20. Whitish. April. Cochinchina. 1822. A synonym of *EVODIA FRAXINIFOLIA.*

Tetrago'nia. New Zealand Spinach. (From *tetra*, four, and *gonia*, an angle; fruit four-angled. Nat. ord., *Ficoideæ*; Tribe, *Mesembryææ.*)

See **NEW ZEALAND SPINACH.** A genus allied to **MESEMBRYANTHEMUM**, from which it differs in the absence of petals.

- T. expa'nsa.* Yellow. August. New Zealand. 1772. Annual. B. M. t. 2362.

Tetragono'lobus. (From *tetra*, four, *gonia*, an angle, and *lobos*, a pod; shape of seed-pod. Nat. ord., *Leguminosæ*; Tribe, *Lotææ.*) See **Lotus.**

Seeds in April, in common soil; the perennials, also, by division and cuttings. Good for the fronts of flower-borders and rock-works.

- T. biflo'rus.* See *Lotus biflorus.*
 — *conjuga'tus.* See *Lotus Requienii.*
 — *maritimus.* See *Lotus siliquosus.*

- T. purpureus*. See *Lotus Tetragonolobus*.
 — *Requienii*. See *Lotus Requienii*.
 — *siliquosus*. See *Lotus siliquosus*.

Tetragonotheca. (From *tetra*, four, and *gonos*, quadrangular, and *theka*, a capsule; the achenes are four-sided. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Tall, hardy, perennial herb. Rich, light soil. Divisions or seeds.

T. helianthoides. 3. Pale yellow. August. North America. 1726.

Tetrame'rium. (From *tetra*, four, and *meros*, a part. Nat. ord., *Rubiaceæ*; Tribe, *Coussareæ*.) A synonym of *Faramea*.

T. odoratissimum. A synonym of *Faramea odoratissima*.

— *paniculatum*. A synonym of *Coffea paniculata*.

Tetrami'era. (From *tetra*, four, and *micros*, small; in allusion to the pollen masses. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Lælicæ*.)

Stove, or greenhouse orchids. For culture, see ORCHIDS.

T. bicolor. White, with purple streaks. Winter. Brazil. 1831. Syn., *Leptotes bicolor*. B. R. t. 1625; B. M. t. 3734.

— *minuta*. A species scarcely two inches high.

— *rigida*. See *Brassavola elegans*. B. M. t. 3098.

— *serrulata*. Greenish; lip white. April. Brazil. Syn., *Leptotes serrulata*.

Tetrane'ma. (From *tetra*, four, and *nema*, a filament; four stamens instead of five, as in *Pentstemon*, which it much resembles. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*.)

Stove herbaceous. Seed sown in a slight hot-bed in March; cuttings of young shoots, a little firm, in sandy soil, under a bell-glass, in April and August; sandy loam and leaf-mould. Winter temp., 45° to 50°. In summer the shelter of the greenhouse or a warm place out of doors.

T. mexicana. 1. Purple, white. June. Mexico. 1843. B. R. 1843, t. 52; B. M. t. 4070.

Tetranthe'ra. (From *tetra*, four, and *aner*, anther; four out of nine stamens fertile. Nat. ord., *Lauraceæ*; Tribe, *Litsæaceæ*.)

Cuttings of young shoots, nearly ripe, in sand, under a bell-glass, and the stove ones in bottom-heat; fibry, sandy loam and turfy peat. Greenhouse and stove temperatures.

GREENHOUSE EVERGREENS.

T. apetalata. See *Litsæa Tetranthera*.

— *geniculata*. See *Litsæa geniculata*.

— *japonica*. See *Litsæa japonica*.

— *laurifolia*. B. R. t. 893. See *Litsæa Tetranthera*.

STOVE EVERGREENS.

T. involucreta. See *T. sebifera*.

— *sebifera*. 10. Yellow, green. May. E. Indies. 1820.

— *trinervis*. 10. Yellow, green. May. Ceylon. 1821.

Tetra'nthus. (From *tetra*, four, and *anthos*, a flower; four-flowered.

Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Stove evergreen trailer. Division and cuttings; sandy loam and a little peat; requires the stove in winter.

T. litorea. 1. White. August. W. Indies. 1820.

Tetrape'litis. (From *tetra*, four, and *pelte*, a small shield; form of flower. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Cælogyneæ*.) See *Otochilus*.

Stove orchid, grown in a basket. See ORCHIDS.

T. fragrans. B. M. t. 3921. See *Otochilus fragrans*.

Tetrapo'gon. (From *tetra*, four, and *pogon*, a beard; the flowers are bearded. Nat. ord., *Gramineæ*; Tribe, *Chlorideæ*.)

Hardy, perennial grass, of little horticultural value.

T. villosus. 1. Pale yellow. North Africa.

Tetra'pterys. (From *tetra*, four, and *pteron*, a wing; the carpels four-winged. Nat. ord., *Malpighiaceæ*; Tribe, *Hirææ*. Allied to *Hiræa*.)

Stove, evergreen, yellow-flowered climbers. For culture, see MALPIGHIA.

T. acapulcensis. May. Mexico. 1824.

— *acutifolia*. May. Cayenne. 1826.

— *citrifolia*. See *T. inæqualis*.

— *discolor*. May. Guiana. 1827.

— *inaequalis*. Yellow. May. Brazil. 1818. Syn., *T. citrifolia*.

Tetrathe'ca. (From *tetra*, four, and *theka*, a cell; and others four-celled. Nat. ord., *Tremandrea*.)

Greenhouse, Australian evergreens, and purple-flowered, where not otherwise specified. Cuttings of young shoots, the side ones are the best, in sand, under a bell-glass, and great care taken to prevent damping; fibry peat, a little turfy loam, and a good portion of charcoal and broken pots. Winter temp., 43° to 50°; summer, an airy situation, but the pot saved from direct sun and heavy rains, or careless waterings.

Tetrazy'gia. (From *tetra*, four, and *zygos*, a yoke; the parts of the flower in fours. Nat. ord., *Melastomaceæ*; Tribe, *Miconiæ*. Allied to *Miconia*.)

Stove, white-flowered evergreens, from the West Indies. Cuttings of side-shoots, getting firm, in sand, under a bell-glass, in heat; sandy

loam and fibry peat. Winter temp., 55° to 60°; summer, 65° to 85°.

- T. angustifolia*. 5. May. 1823. Syn., *T. eleagnoides* of B. M. t. 4383.
— *discolor*. 5. May. 1793.
— *eleagnoides*. 4. March. See also *T. angustifolia*.
— *tetra'nara*. 3. March. 1815.

Tettigonia spumaria of some entomologists, and the *Cercopis*, *Cicada*, or *Aphrophora spumaria* of others, Froth insect, Cuckoo-spit, Froth-hopper, or Frog-hopper. The larva enveloped in its froth is especially prevalent upon the young shoots of the white-thorn or quick; but it also infests the stems of pinks, carnations, lilacs, and many other plants. If the froth be removed, one and sometimes two small, pale green, aphid-like insects are detected. These are the larvæ or young of the Froth-fly. By means of its sharp rostrum or beak it extracts the sap of the plant, and voids it as an excrement in the frothy form, which is its characteristic. About the end of July it sheds its skin, leaving it in the froth, and comes forth the perfect insect. About the beginning of August the males and females may be found in pairs numerously on the plants they frequent. They are of a dirty-white colour, thickly dotted and clothed with short hairs; head broad and bluntly triangular, with black lines down its centre and sides; eyes, one on each side, near the base of the head; rostrum long, bent underneath its body when not in use; antennæ ending in a fine bristle; thorax and shield (scutellum), adjoining the back of the head, brownish. The wing-cases are brown, mottled with ochre, with four whitish patches on the margin; the under wings are transparent and iridescent. The legs, six in number, short, but two hind-legs longest, and formed for leaping. So effectual are they for the purpose, that, as Mr. Kirby states, after showing their mode of leaping, they will spring five or six feet at a time, being more than 250 times their own length, or "as if a man of ordinary height should be able to vault through the air to the distance of a quarter of a mile." It is not ascertained where the eggs of this insect are deposited, but probably on the stems of the plants on the shoots of which the larva feeds. It appears, however, that they can travel after hatching, for seedlings and plants raised from root-cuttings are often affected. We know of no better plan for destroying the insect than drawing the affected shoots between the fingers, and then dipping these into a bowl of water after each grasp. In the case of carna-

tion stems and other flowers, requiring more tender treatment, all the froth may be taken from the insect by means of a piece of sponge, and itself then removed by a camel's hair brush.

Teucrium. Germander. (Named after *Teucer*, a Trojan prince, who first used it medicinally. Nat. ord., *Labiatae*; Tribe, *Ajugoideæ*. Syn., *Leucoscepttrum*.)

Annuals by seeds in the open ground in April; perennials, by seeds and divisions; shrubs, by cuttings in sandy soil, under a bell-glass, in spring, and a hand-light in summer. Most of them in the atmosphere of London, and farther north, require a cold pit or a greenhouse in winter. In dry places in the south of England they will frequently stand our winters uninjured. They are not at all particular as to soil.

Tha'mnea. (From *thamos*, a shrub. Nat. ord., *Bruniaceæ*.)

Greenhouse evergreen shrub. Cuttings of the young shoots in sand, under a bell-glass, in April, and then set in a close pit; fibry, sandy peat, and a little charcoal and freestons. Winter temp., 40° to 48°.

T. uniflora. White. April. South Africa. 1810.

Tha'psia. (The Greek name of *T. gargarica*. Nat. ord., *Umbelliferae*; Tribe, *Laserpiticeæ*.)

The species to which the ancient Greeks gave the name of THAPSIA, has been long celebrated for its healing powers, the root being used externally as a remedy for all kinds of pain, and for the reduction of tumours, by the Moors. Greenhouse perennials, with a thick carrot-like root. Seeds, or breaks from the root. Loam. Summer temp., 60° to 85°; winter, 48° to 60°.

T. decipiens. 6. White. Madeira. 1867.

— edulis. 4. White. May. Madeira. 1857. Syn., *Monizia edulis*. B. M. t. 5724.

— gargarica. Yellow. Mediterranean region. 1683. Sibth. Fl. Gr. t. 287.

— villosa. 4. Yellow. June. South Europe. 1710.

Thatch Palm. *Euterpe*, *Sabal*, and *Thrinax*.

The'a. Tea. (From *tea*, the Chinese name for tea. Nat. ord., *Ternstroemiae*; Tribe, *Gordoniaceæ*.) Now united with **Camellia**.

Greenhouse, white-flowered, evergreen shrubs. Cuttings of ripened young shoots, taken off at a joint, inserted in silver sand, under a bell-glass, and placed in a close pit, the glass being opened at night to prevent damping; also by layers from shoots thrown up by the roots; also, we believe, by grafting the tenderer kinds. Equal parts of fibry peat and sandy, turfy loam packed tight. Winter temp., 38° to 48°. As the roots run deep, they thrive best when planted out in a cool conservatory. Plants have survived many winters round London in the open ground with the protection of a mat in cold weather.

T. Bohea, B. M. t. 998, and *T. viridis*, B. M. t. 3148, are forms of *Camellia Thea*.

— maliflora. A synonym of *Camellia roseiflora*.

Theezan Tea. *Rhad'nurus thee'zans*.

Thelymitra. (From *thelys*, a woman, and *mitra*, a cap; in allusion to the hood-shaped column. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Spirantheæ*.)

Greenhouse, terrestrial orchids.

T. carnea. 1-1. Pink. May. Australia. 1820.

— Forsteri. } See *T. longifolia*.

— graminea. }

— zivoides. 1. Blue. May. Australia. 1810.

— longifolia. 1. Blue to Pink. May. Australia. 1824. Syns., *T. Forsteri*, *T. graminea* and *T. pauciflora*.

— pauciflora. See *T. longifolia*.

— variegata. 1. Purple. May. Australia. Syns., *Macdonaldia spiralis* and *M. variegata*.

— venosa. 1-2. Blue. April. Australia. 1826. Syn., *Macdonaldia venosa*.

Themistocle'sia. (After *Themistocles*, a Grecian statesman. Nat. ord., *Vacciniaceæ*; Tribe, *Euvaccinieæ*.)

Stove, evergreen shrub. Turfy loam, peat and sand. Cuttings.

T. coronilla. Red. Columbia. 1866. Syns., *Ceratostemma coronarium* and *Thibaudia coronaria*. B. M. t. 5575.

Thenard'sia. (Named after *M. Thenard*, a French chemist. Nat. ord., *Apocynaceæ*; Tribe, *Echitideæ*.)

Stove evergreen climber. Cuttings of stubby side-shoots in sand, under a bell-glass, and in heat; sandy, fibry loam and peat, with a little charcoal. Winter temp., 55° to 60°; summer, 65° to 85°.

T. floribunda. 10. Blue. Mexico. 1823.

Theobroma. Chocolate-tree. (From *theos*, a god, and *broma*, food; poetically, food for the gods. Nat. ord., *Sterculiaceæ*; Tribe, *Buettnerieæ*. Syn., *Cacao*.)

The seed of *T. Cacao* is the chief ingredient in chocolate and cocoa. Stove evergreen trees. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat; fibry loam and sandy peat. Winter temp., 55° to 65°; summer, 65° to 88°.

T. bicolor. 16. Brown. New Grenada. 1820.

— Cacao. 16. Brown. S. America. 1739. B. C. t. 645.

— caribæa. Yellow. W. Indies. 1821.

— Guazuma. A synonym of *Guazuma ulmifolia*.

— guianensis. 16. Yellow. Guiana. 1803.

Theophrasta. (Named after *Theophrastus*, the father of natural history. Nat. ord., *Myrsineæ*; Tribe, *Theophrasteæ*.)

Stove white-flowered evergreens. Cuttings of ripe young shoots in sand, under a bell-glass, in heat; sandy loam and fibry peat. Winter temp., 50° to 58°; summer, 60° to 85°.

T. argyrea. 1860.

— imperialis. B. M. t. 6823. See *Chrysophyllum imperiale*.

— Jussieui. 3. St. Domingo. 1818. B. M. t. 4239.

— latifolia. S. America.

— longifolia. Jacq. H. Schoenb. t. 116. A

synonym of *Clavija ornata*.

— macrophylla. Brazil.

— pinna'ta. See *Talisia princeps*.

— smaragdina. See *Deherainia smaragdina*.

— umbrosa. See *Clavija umbrosa*.

There'sia. (Commemorative, but of whom not explained. Nat. ord., *Liliaceæ*; Tribe, *Tulipeæ*.) See **Fritillaria**. Hardy bulb. For cultivation, see **LILIUM CANDIDUM**.

T. persica. A synonym of *Fritillaria persica*.

Thermometer. This instrument is the only unfailing guide for the gardener in regulating the heat to which he allows the roots and foliage of his plants to be subjected.

Fahrenheit's is used chiefly in Britain, Holland, and North America, the freezing point of water on which is at 32°; and its boiling point, 212°. *Reaumur's* thermometer was that chiefly used in France before the Revolution, and is that now generally used in Spain, and in some other continental states. In its scale

the freezing point is 0°; and the boiling point, 80°. On *Celsius* or the *Centigrade* thermometer, now used throughout France, and in the northern kingdoms of Europe, the freezing point is 0°; and the boiling point, 100°. Hence, to reduce degrees of temperature of the Centigrade thermometer and of that of Reaumur to degrees of Fahrenheit's scale, and conversely :

Rule 1. Multiply the Centigrade degrees by 9, and divide the product by 5; or multiply the degrees of Reaumur by 9, and divide by 4; then add 32 to the quotient in either case, and the sum is the degrees of temperature of Fahrenheit's scale.

Rule 2. From the number of degrees on Fahrenheit's scale subtract 32; multiply the remainder by 5 for Centigrade degrees, or by 4 for those of Reaumur's scale, and the product, in either case, being divided by 9, will give the temperature required according to Fahrenheit's.

To ascertain the internal temperature of a hothouse, the thermometer should be fixed near its centre, against a pillar, and under a cupola, or little roof, shading it from the sun.

A self-registering thermometer should be in every house, for it shows the highest and lowest degrees of heat which have occurred in the twenty-four hours; and, therefore, serves as a check upon those to whose care they are intrusted.

Bregazzi's bark-bed thermometer is an excellent instrument for ascertaining the bottom-heat of hot beds, bark-pits, etc. It is a thermometer inclosed in a metal tube, perforated to admit the heat, pointed, so as to be easily thrust down, and with a small door in the side, for observing the degree of temperature shown by the scale.

Thermo'psis. (From *thermos*, a lupine, and *opsis*, like; lupine-like shrub. Nat. ord., *Leguminosæ*; Tribe, *Podalyriæ*. Allied to *Piptanthus*.)

Hardy herbaceous yellow-flowered perennials. Chiefly by seeds sown in April; light, sandy loam.

- T. barba'ta*. 1½. Purple. June. Himalaya. 1855.
 — *corgone'nsis*. 1. July. Altaia. 1820. Syn., *Sophora alpina*.
 — *fabace'a*. 2. June. N. America. 1811. B. M. t. 3611. Syn., *Sophora fabacea*.
 — *laburnifo'lia*. B. C. t. 1095. A synonym of *Piptanthus nepalensis*.
 — *lanceola'ta*. 1. June. Siberia. 1779. Syn., *Podalyria lupinoides*.

- T. monta'na*. 1. June. N. America. 1818.
 — *nepale'nsis*. See *Piptanthus nepalensis*.
 — *au'rea*. See *Piptanthus nepalensis*, var. *aurea*.

Theropo'gon. (Compounded from *theros*, summer, and the termination of *Ophiopogon*; in allusion to its resemblance to *Ophiopogon*, and the annual renewal of its leaves in summer. Nat. ord., *Liliacæ*; Tribe, *Convallariæ*. Allied to *Polygonatum*.)

Greenhouse herbaceous perennial, of tufted habit with grass-like leaves. Seeds sown in a slight hotbed in spring; divisions of the plant. Sandy loam and leaf-mould. Summer temp., 55° to 75°; winter, 40° to 50°.

- T. pallidus*. ½. Pink. Himalaya. 1875. B. M. t. 6154.

The'sium. (From *Thession*, a name used by Theophrastus. Nat. ord., *Santalacæ*.)

A large genus of herbaceous plants, scarcely worth cultivation.

- T. drupa'ceum* is a synonym of *Leptomeria Billardieri*.

Thespe'sia. (From *thespesios*, divine; one of the trees often planted round places of worship in India. Nat. ord., *Malvacæ*; Tribe, *Hibiscæ*.)

Stove evergreen trees. Cuttings of stubby side-shoots in sand, in May, under a bell-glass, in bottom-heat; fibry, sandy loam, and a little leaf-mould. Winter temp., 48° to 55°; summer, 65° to 85°.

- T. grandiflo'ra*. 30. Scarlet. Porto Rico. 1837.
 — *populnea*. 30. White. Tropics of the Eastern Hemisphere. 1770. Wight, Ic. t. 8.
 — *gadalupe'nsis*. 30. Cultivated in Guadeloupe.

Theve'tia. (In honour of *M. Thevet*. Nat. ord., *Apocynacæ*; Tribe, *Plumariæ*.)

Stove evergreen shrubs. Cuttings in sand, under a bell-glass in heat. Fibrous loam. Summer temp., 60° to 80°; winter, 55° to 60°.

- T. Ahou'ei*. 20. Yellow. June. Brazil. 1739. Syn., *Cerbera Ahouai*. Andr. Rep. t. 231; B. M. t. 737.
 — *neriifo'lia*. 12. Yellow. June. S. America. 1785. Syn., *Cerbera Thevetia*. B. M. t. 2309.
 — *Ycco'tli*. 8. Yellow. June. Mexico. 1800. Syn., *Cerbera thevetioides*.

Thibau'dia. (Named after *Thiebaud de Berneaud*, a French botanist. Nat. ord., *Vacciniacæ*; Tribe, *Thibaudiæ*.)

Stove evergreens. Cuttings of half-ripe shoots in sand, under a bell-glass, and in moist heat; sandy loam and fibry peat. Winter temp., 50° to 60°; summer, 60° to 85°.

- T. acumina'ta*. B. M. t. 5752. See *Cavendishia acuminata*.

 — *variegata*. See *Agapetes variegata*.

Thinning. The exhaustion consequent upon the excessive production of seed is one of the many causes of the decay of plants. This explains why fruit-trees are weakened or rendered temporarily unproductive, and even killed, by being allowed to ripen too large a crop of fruit, or to "overbear themselves."

The thinning of fruit is, consequently, one of the most important operations of the garden, though one of the least generally practised. It is equally important to be attended to in all fruit-bearers, but especially the vine, nectarine, peach, apricot, apple, and pear. It should be done with a bold, fearless hand; and the perfection of that which is allowed to remain will amply reward the grower, in harvest time, for the apparent sacrifice made. But he will not reap his reward only in this year, for the trees, thus kept unweakened by over-production, will be able to ripen their wood, and deposit their store of sap in their vessels, so absolutely necessary for their fruitfulness next season.

Thinning is a most necessary operation with plants as well as with the fruit they bear. The roots of a plant extend in a circle round it, of which the stem is the centre. If the roots of adjoining plants extend within each other's circle, they mutually rob of nutriment, and check each other's growth. Thinning in the seed bed is generally applied with too timid a hand.

Thistle. Various species of *Carduus*, *Cnicus*, etc.

Thistle, Blessed. *Silybum Maria-num*.

Thistle, Cotton. *Oenopordon Acanthium*.

Thistle, Globe. *Echinops*.

Thistle, Golden. *Scolymus hispanicus*.

Thistle, Hedgehog. *Echinocactus*.

Thistle, Holy. *Silybum Maria-num*.

Thistle, Melon. *Melocactus*.

Thistle, Our Lady's Milk. *Silybum Maria-num*.

Thistle, Sow. *So'nchus*.

Thladiantha. (From *thladias*, a enunch, and *anthos*, a flower. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumerineæ*.)

Greenhouse climber. For cultivation, see **SECIUM**.

T. du'bia. Yellow. China. 1864. B. M. t. 5469.

Thlaspi. Penny Cress. (From *Thlaspis*, a name for Cress used by Dioscorides. Nat. ord., *Cruciferae*; Tribe, *Thlaspidæ*.)

Hardy, annual or perennial herbs.

T. arabicum. A synonym of *Æthionema Buxbaumii*.

— *cepecefolium*. ½. Pink. July. Carinthia. 1824. Syn., *Hutchinsia cepecefolia*.

— *luteum*. A synonym of *Bivonæa lutea*.

— *pumilum*. June. Caucasus. 1821. Syn., *Hutchinsia pumila*.

— *rotundifolium*. ½. White. Purple. June. South Europe. 1759. Syn., *Hutchinsia rotundifolia*.

— *saxatile*. A synonym of *Æthionema saxatile*.

Thomasia. (Named after Messrs. Thomas, two brothers, collectors of Swiss plants. Nat. ord., *Sterculiaceæ*; Tribe, *Lasiopetalæ*. Allied to *Lasiopetalum*.)

Greenhouse, Australian, evergreen shrubs. Cuttings of firm, stubby, young side-shoots in sand, under a bell-glass, in April; sandy, fibry loam and peat, with a little charcoal and broken pots, and the pots extra well-drained. Winter temp., 40° to 48°; a sheltered, airy place in summer.

T. canescens. Purple. June. 1835.

— *diffusa*. White. April. 1822.

— *dumosa*. 2½. White. May. 1826.

— *foliosa*. 3. June. 1823.

— *glutinosa*. Red. May. 1842.

— *latifolia*. Pink. Summer. 1885. Gf. t. 1186.

— *grandiflora*. Red. 1840.

— *macrocarpa*. 3. Red. June. 1842.

— *paniculata*. Red. June. 1842.

— *pauciflora*. Red. June. 1848.

— *purpurea*. 3. Purple. June. 1803. Syn., *Lasiopetalum purpurcum*. B. M. t. 1755.

— *quercifolia*. 3. Purple. May. 1803. Syn., *Lasiopetalum quercifolium*. B. M. t. 1485.

— *solanacea*. 3. White. June. 1803.

— *stipulacea*. 3. Red. 1842. B. M. t. 4111.

— *triphylla*. 3. June. 1824. Syn., *Lasiopetalum triphyllum*.

Thomsonia. (In honour of Dr. A. T. Thomson, 1778-1849. Nat. ord., *Aroideæ*; Tribe, *Pythoniæ*.)

Stove, tuberous, perennial herbs. For culture, see **CALADIUM**.

T. hookeri. 2. Churra, India. 1840.

— *nepalensis*. 2. Green, purple, yellow. Nepal. 1816.

Thorn. Various species of *Cratægus*, etc.

Thorn Apple. *Datu'ra Stramo'-nium.*

Thorn Bloom. *U'lex europæ'us.*

Thorn, Christ's. *Paliu'rus aculea'-tus* and *Zi'zyphus Spi'na-Chri'sti.*

Thorn, Garland. *Paliu'rus aculea'tus.*

Thorn, Jerusalem. *Parkinsonia aculea'ta.*

Thorough-Wax. *Bupleu'rum rotundifo'lium.*

Thou'nia. (Named after *A. Thouin*, professor of agriculture, etc., in Paris. Nat. ord., *Sapindacæ*; Tribe, *Sapindacæ*. Allied to *Talisia*.)

Stove evergreen shrub. Cuttings of firm side-shoots in sand, under a bell-glass, in heat; sandy, fibry loam and a little peat or leaf-mould. Winter temp., 50° to 53°; summer, 60° to 85°.

T. pinna'ta. 8. White. New Spain. 1823.

Three Birds Orchid. *Pogo'nia pe'ndula.*

Thrift. *Arme'ria mari'tima.* See **Edging.**

Thri'nax. (From *thrinax*, a fan; shape of the leaves. Nat. ord., *Palmeæ*; Tribe, *Coryphææ*.)

Stove palms. Seeds in a moist, sweet hotbed, in spring; rich, loamy soil. Winter temp., 55° to 60°; summer, 60° to 90°.

T. arge'ntea. 16. W. Indies. 1830.

— *barbade'nsis.* 12. Barbados. 1875.

— *el'egans.* Central America. 1861. Very dwarf.

1778.

— *pu'milio.* Jamaica. 1738.

— *radia'ta.* Trinidad. 1838.

— *stella'ta.* Cuba. 1852.

Thrips. *Heliothrips Adonidum* is one of the worst pests that can gain a footing in our stoves and greenhouses. The larvæ and pupæ are yellowish-white, and the perfect insect is of a dull, deep black, with the point, and sometimes the whole of the abdomen, of a rust colour; the wings are dirty white; the horns and legs yellowish, the extremity of the former black. It attacks plants by piercing the under side of the leaves; and one often sees, at the tip of the tail, a globule

of blackish fluid, which it soon deposits, and, by innumerable spots of this glutinous matter, the pores of the leaves are stopped up, and large portions of the surface become blotched. During March the full-grown larvæ and pupæ, which are as large as the perfect insect, are found in groups, feeding on the under side of the leaves; and at this time the recently-hatched but perfect insect either lies close under the ribs, or roves about in search of a mate (*Curtis*). Flowers of sulphur have been recommended as destructive of this plague, but we believe that Scotch snuff, applied by means of a dredging-box (perhaps Brown's Fumigator would answer), is as effectual an application as any. Prevention, however, is better than cure; and if the plants are kept healthy by due ventilation, and by moisture both in the air and soil, this insect may be usually banished.

Thrips ochraceus infests the ripe fruit of plums, peaches, and nectarines, piercing the stalks, and causing their fall, and rendering the fruit disgusting. It was first noticed and described by Mr. Curtis. It is narrow and linear, of a bright and deep ochreous colour, the eyes are black, the horns appear to be only six-jointed and brownish at the tips, it has three ocelli in the crown, the body is hairy, the tip pointed and bristly, the wings are shorter than the body in the male, lying parallel on the back when at rest, narrow, especially the under ones, and fringed, the hairs longest beneath and at the point, tips of feet dusky. It is destroyed by the same means as *Heliothrips Adonidum*.

Thrixsper'mum. (From *thrix*, a hair, and *sperma*, a seed; in allusion to the slender hairlike seeds. Nat. ord., *Orchidæ*; Tribe, *Vandææ-Sarcantheæ*.) A synonym of **Sarcochilus**.

Stove epiphytal orchid. Should be grown on blocks. See ORCHIDS.

T. Berkele'yi. A synonym of *Sarcochilus Berkele'yi*.

— *Freema'nii.* See *Sarcochilus Freemanii*.

— *Hartma'nni.* See *Sarcochilus Hartmanni*.

— *indusa'tum.* See *Sarcochilus indusiatum*.

— *lunif'erum.* Ochre, white, brown. Burmah.

1868.

— *Moo'rei.* ♂. Yellow, brown. Solomon Islands.

1880.

— *muricula'tum.* Pale ochre, purple. India.

1881.

— *Sillema'num.* A synonym of *Sarcochilus*

Sillemanum.

— *unguicula'tum.* See *Sarcochilus unguiculatum*.

Thrya'llis. (A name used by Theophrastus. Nat. ord., *Malpighiaceæ*; Tribe, *Malpighiææ*.) A synonym of **Galphimia**.

T. brachysta'chys. 4. August. Rio Janeiro. 1823. B. R. t. 1162.

Thrypto'mene. (From *thrypto*, to break or crush; in allusion to the fragile appearance of the plant. Nat. ord., *Myrtaceæ*.)

Heath-like, greenhouse shrub. For culture, see BÆCKEA.

T. saxicola. 3. White. July. Australia. 1824. Syn., *Bæckea saxicola*. B. M. t. 3160.

Thu'ja. See **Thuya**.

Thujo'psis. See **Thuyopsis**.

Thunbe'rgia. (Named after C. P. Thunberg, the celebrated botanist. Nat. ord., *Acanthaceæ*; Tribe, *Thunbergiæ*.)

Stove evergreen climbers. Seeds in early spring, in a strong, moist, sweet hotbed; cuttings any time before the end of August, in sandy soil, under a bell-glass; fibry loam and peat, with a little rotten dung and lime rubbish. Winter temp., 48° to 60°; summer, 60° to 80°. As they are very subject to red spider, perhaps the best mode of treating these fine plants is to grow them as annuals, throwing the plants away in the end of autumn. If preserved, the flowers of sulphur and the syringe must hardly ever have a holiday. Indeed, the syringe and a little shade are necessary to their health in summer.

T. affinis. Violet; throat yellow. September. Zanzibar. 1837. B. M. t. 6975.

— *alata*. 4. Yellow. June. South Africa. 1823. B. M. t. 2591.

— *alba*. 4. White. May. Madagascar. Swt. Fl. Gard. ser. 2, t. 392.

— *variegata*. Some branchlets pale yellow.

— *walthamensis*. 8. Pyramidal.

— *orientalis*. 20. China and Japan. 1860. Pyramidal. Syns., *T. acuta* and *Biota orientalis*.

— *argentea*. Branchlets variegated with white.

— *ascotensis*. Branches bright golden.

— *athrotaxoides*. Dwarf variety.

— *aurea*. 3. Golden-yellow.

— *elegantissima*. Tips of young shoots golden-yellow.

— *falcatula*. Pyramidal.

— *funiculata*. Branchlets bright green.

— *glauca*. Covered with a silvery powder.

— *gracilis*. A slender variety. Nepal.

— *macrocarpa*. Branches drooping. Cones large.

— *monstrosa*. Branches few, contorted.

— *pekinensis*. 60. Pekin. 1861.

— *pendula*. 15. Japan. Syn., *Biota pendula*. Weeping Arbor Vitæ.

- T. orientalis pyramidalis*. 30. Pyramidal.
 — *sempervirens*. Golden throughout the year.
 — *Sieboldii*. Conical, dwarf, bright green.
 — *triangularis*. Branchlets arranged in a triangular manner.
 — *variegata*. Branchlets bright golden and green.
 — *Zuccariniana*. Dwarf, bright green.
 — *plicata*. 20. Nootka Sound. 1796.
 — *minima*. A dwarf, slow-growing variety.
 — *variegata*. Variegated with pale yellow.
 — *Standishii*. Japan. 1862. Syn., *Thuyopsis Standishii*.
 — *tatarica*. 10. Syn., *T. Wareana*.
 — *compacta*. Compact, conical. 1886.
 — *tetragona*. See *Libocedrus tetragona*.
 — *Wareana*. See *T. tatarica*.

Thuyopsis. (From *Thuya*, the arbor-vitæ, and *opsis*, resemblance. Nat. ord., *Coniferae*; Tribe, *Cupressineæ*. Syn., *Thuyopsis*.)

Hardy evergreens.

- T. borealis nidiifera*. A seedling variety with plume-like branches.
 — *dotabrata*. 50. Japan. There is a variety with white-blotched twigs.
 — *latevirens*. Japan. 1862. Syn., *Thuya latevirens*.
 — *variegata*. Variegated with pale yellow.
 — *Standishii*. See *Thuya Standishii*.

Thymbra. (An ancient name applied to a thyme-like plant. Nat. ord., *Labiatae*; Tribe, *Satureineæ*. Allied to *Melissa*.)

Half-hardy evergreens. Seeds in April, or cuttings under a hand-light in June; sandy, gravelly loam. Nice rock-work plants, requiring a cold pit in winter.

- T. caroliniana*. A synonym of *Macbridea pulchra*.
 — *ciliata*. See *Thymus ciliatus*.
 — *spicata*. 1½. Pale purple. June. Levant. 1699. Sibth. Fl. Gr. t. 546.

Thyme. *Thymus*.

Thyme, Basil. *Calamintha Afcinos*.

Thyme, Water. *Eloëa*.

Thymelæa. (From *thymos*, thyme, and *elaia*, olive; the leaves resemble those of thyme, the fruits those of the olive. Nat. ord., *Thymelacæe*.)

Hardy, or half-hardy shrubs. Loam and peat in equal parts. Cuttings.

- T. arvensis*. 1½. Yellowish. Syn., *Stellera Passerina*. Jacq. Ic. t. 68.
 — *hirsuta*. 2. White. July. Mediterranean region. 1759. Syn., *Passerina hirsuta*. B. M. t. 1949. Half-hardy.
 — *Tartonnæra*. See *Daphne Tartonnæra*.

Thymus. Thyme. (From *thuo*, to perfume. Nat. ord., *Labiatae*; Tribe, *Satureineæ*.)

Hardy evergreen trailers, and purple-flowered, except where otherwise mentioned. Seeds, cuttings, or divisions in March or April; sandy loam suits them all best. *T. vulgaris* is our common pot-herb thyme. For culture, see SAGE.
T. alpinus. B. M. t. 2153. A synonym of *Calamintha alpina*.

- T. angustifolius*. ½. June. South Europe. 1771.
 — *azoricus*. July. Azores. 1820. B. C. t. 1530.
 — *azureus*. ½. June. South Europe. 1830.

 — *Zygis*. See *T. striatus*.

Thysacanthus. (From *thyrse*, a thyrse, and *Acanthus*; thyrse-flowered *Acanthus*. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.)

Stove evergreen shrubs. For culture, see GEISOMERIA. They must be spurred in closely. Flowers nearly all the year.

- T. barlerioides*. Red. Minas Geraes. Fl. Ser. t. 986.
 — *bracteolata*. 2. Red. July. New Grenada. 1823. B. M. t. 4441. Syn., *Justicia bracteolata*. Jacq. Ic. t. 205.
 — *callistachyus*. 2. Red. Mexico. Syn., *T. lilacinus*. Paxt. Fl. Gard. t. 53, and *Justicia lilacina* of gardens.
 — *coccineus*. See *T. Lemaireanus*.
 — *indicus*. B. M. t. 5062. A synonym of *Asystasia Thysacantha*.
 — *Lemaireanus*. 3. Red. February. Honduras 1840. Syn., *T. coccineus*, *T. strictus*. B. M. t. 4378, *Aphelandra longiscapa*, *Branthemum coccineum*, Fl. Ser. t. 240, and *Justicia longiracemosa*.
 — *lilacinus*. See *T. callistachyus*.
 — *nitidus*. 4. Red. West Indies. Syn., *Justicia nitida*. Andr. Rep. t. 570.
 — *rutilans*. 2. Deep red. Winter. Columbia. 1851. See also *T. Schomburgkianus*.
 — *Schomburgkianus*. 3. Bright crimson. Winter. New Grenada. 1855. B. M. t. 4851. Syn., *T. rutilans* of Fl. Ser. t. 732.
 — *strictus*. See *T. Lemaireanus*.

Thyrso'pteris. (From *thyrsus*, a staff, and *pteris*, a fern; alluding to the contracted fertile portion of the fronds. Nat. ord., *Filices*—*Polypodiaceae*.)

T. elegans. 15. Juan Fernandez.

Thysano'tus. (From *thysanotos*, fringed: the flower much fringed. Nat. ord., *Liliaceae*; Tribe, *Asphodeleae*.)

Greenhouse, purple-flowered, from Australia. By division of the plant in the herbaceous, and dividing the tuberous-rooted kinds; sandy loam and leaf-mould. Winter temp., 38° to 45°, and very little water.

GREENHOUSE HERBACEOUS.

T. intricat'us. ‡. July. 1838. B. R. 1840, t. 4.
— *ju'nceus*. †. 1804. B. R. t. 656.
— *proli'ferus*. 1. August. B. R. 1838, t. 8.
— *te'nais*. Lilac. May. 1836. B. R. 1838, t. 50.

GREENHOUSE TUBERS.

T. elat'ior. 1. August. 1823.
— *isanthe'rus*. ‡. August. 1822. B. R. t. 655.
— *tuberos'us*. 1. June. 1825.

Tiare'lla. (From *tiara*, a little diadem; form of seed-pod. Nat. ord., *Saxifragaceae*; Tribe, *Saxifrageae*.)

Hardy, white-flowered herbaceous plants. Divisions of the root; common soil; dry borders, and the front of them, or elevated places in rock-works.

T. cordifo'lia. †. April. N. America. 1731. B. M. t. 1589.
— *Menzie'sii*. See *Tolmiea Menziesii*.
— *polyphy'lla*. 1. April. Nepaul. 1820.

Tiari'dium. (From *tiara*, a diadem, and *eidos*, like; form of seed-pod. Nat. ord., *Boraginaceae*; Tribe, *Heliotropiceae*.) This genus is now united with **Heliotropium**.

Annuals. Seeds in a slight hotbed at the end of March, pricked off, and planted out towards the end of May. Perhaps *anisophyllum* will require a warm corner, or to be bloomed in a pot, in the greenhouse.

T. anisophy'llum. White. June. Africa. 1822.
— *indicum*. 1. Blue. June. W. Ind. 1820.
A synonym of *Heliotropium indicum*.
— *veluti'num*. 1. Blue. June. W. Ind. 1820.

Tibouchi'na. (The native name in Guiana. Nat. ord., *Melastomaceae*; Tribe, *Osbeckieae*.) See **Pleroma**.

Stove evergreen. Cuttings of firmish side-shoots in sand, under a bell-glass, and in a mild bottom-heat, any time between April and August; fibry peat and sandy loam, with a little charcoal and broken pots, and extra care in draining. Winter temp., 55° to 60°; summer, 65° to 88°.

T. Matho'i. See *Pleroma barbigerum*, var. *lepidotum*.

Tico'rea. (The native name of *T. foetida*. Nat. ord., *Rutaceae*; Tribe, *Cusparieae*. Allied to *Galipea*.)

Stove, white-flowered, evergreen trees. Cuttings of ripe young shoots in sand, under a bell-glass, in heat, in March; fibry loam and sandy peat. Winter temp., 50° to 55°; summer, 60° to 80°.

T. foetida. 10. Guiana. 1825.
— *jasmiflora*. 20. Brazil. 1827.

Tiga'rea. (From the Guianese name. Nat. ord., *Rosaceae*; Tribe, *Potentilleae*.) A synonym of **Purshia**.
T. tridentata. A synonym of *Purshia tridentata*.

Tiger Iris. *Tigri'dia*.

Tiger Lily. *Lilium tigri'num*.

Tigri'dia. Tiger Flower. (From *tigris*, a tiger, and *eidos*, like; resemblance of the spotted flowers. Nat. ord., *Irideae*; Tribe, *Moraceae*. Syns., *Beatonia* and *Hydrotenia*.)

Having yielded to cross-breeding, this genus may be expected to run into varieties of very gay colours. Half-hardy or greenhouse bulbs, from Mexico. Seeds in a slight hotbed, in spring; also by offsets; sandy loam and leaf-mould; protected in the ground from frost and wet, or taken up at the end of autumn, and kept in a dry, cool place, the roots being covered with earth until planting-out time in the middle of April.

T. atra'ta. 2. Dark purple. August. Mexico. 1843. Syn., *Beatonia atrata*.
— *bucci'fera*. 1. Greenish-yellow, with purple dots at the base. Jalisco Mts., Mexico. Gard. and For. 1889, p. 412, fig. 125.
— *conchifo'ra*. Swt. Fl. Gard. t. 128. See *T. pavonia*, var. *conchiflora*.
— *curva'ta*. Purple. April. Del Monte. 1843. Syn., *Beatonia curva'ta*.
— *grandiflora a'lba*. White, base of segments yellowish with reddish-brown spots. 1882.
— *Herberti*. B. M. t. 2599. A synonym of *Cypella Herberti*.
— *lu'tea*. ‡. Yellow. June. Peru. 1843. B. M. t. 6295. Syn., *Beatonia lutea*.
— *meale'dgris*. 1‡. Purple. Spring. Mexico. Syn., *Hydrotenia meleagris*, B. R. 1842, t. 39.
— *pavonia*. 1-2. Orange, red. June. Mexico. 1796. Red. Lil. t. 6. Syns., *Ferraria pavonia*, Andr. Rep. t. 178, and *F. Tigridia*, B. M. t. 532.
— *albiflora*. White.
— *conchifo'ra*. Deep yellow. Syn., *T. conchiflora*, Paxt. Mag. xiv. p. 53.
— *speciosa*. A brightly coloured variety. Fl. Ser. t. 908, fig. 1.
— *Pringlei*. 1-2. Scarlet, orange, blotched with crimson. Chihuahua. Gard. and For. 1888, p. 388, fig. 61.
— *Van-Houttei*. 1. Yellow, lilac. Spring. South Mexico. 1875. Fl. Ser. t. 2174.
— *viola'cea*. 1. Rose-purple, white. May. South Mexico. 1838. Syn., *Beatonia purpurea*.

Tigris, Flower of. *Tigri'dia pavonia*.

Tile-Root. *Geissorhi'za*.

Tilia. Lime or Linden-tree. (A name used by Virgil for the Lime. Nat. ord., *Tiliaceae*; Tribe, *Tiliceae*.)

Hardy, deciduous, yellowish-green-flowered trees. Seeds, gathered and preserved in moist sand until March or April, and then some will generally vegetate that and the following season; principally, however, by layers in autumn, which may be removed in a twelvemonth. To save layering, old trees are sometimes cut down; shoots spring up in abundance; among these six

inches or a foot of fine soil is thrown, and in two or three years nice-rooted plants are obtained. Deep, loamy soil suits all the varieties, as well as the species, best. The white lime is propagated chiefly by layers and grafting. *T. americana* and its many varieties are very ornamental, but not so hardy as the European in our moist climates.

- T. alba*. Wats. Dendr. t. 71. See *T. argentea*.

Tillandsia. (Named after E. Tillands, physician at Abo. Nat. ord., Bromeliaceæ; Tribe, Tillandsiæ. Syn., *Vriesia*.)

Stove epiphytes. Divisions and suckers. The weaker kinds do best in very shallow baskets, in sphagnum, turfy peat, broken pots, and charcoal; the stronger-growing ones may be potted

high in turfy peat, a little turfy loam, and charcoal. Winter temp., 55° to 60°; summer, 60° to 80°.

Tille'tia. Bunt. The most common species of this genus of Fungi is *T. Tritici* (Syn., *T. caries*), which attacks the ovaries of wheat. The diseased grains become filled with a mass of dark brown powdery matter, which on microscopic examination are seen to consist of spherical granules with a reticulated surface. These granules under favourable circumstances emit a tube, bearing needle-shaped sporidia at its apex (as

shown in the accompanying figure, one sporidium being detached).

These conidia sometimes conjugate before falling off to reproduce the fungus.

Timo'nus. (From the Malayan name. Nat. ord., *Rubiaceae*; Tribe, *Chiococceae*.)

Stove, evergreen tree. Sandy, fibry loam and a little peat. Cuttings.

T. Ru'mphii. 12. White. East Indies. 1823. Syn., *Erihalis Timon*.

Tina'ntia. (After a Belgian botanist named *Tinant*. Nat. ord., *Comelinaceae*; Tribe, *Tradescantieae*.)

Half-hardy, perennial herb. For culture, see TRADESCANTIA.

T. fulgax erecta. 1‡. Blue or purplish. July. S. America. 1794. Syn., *Tradescantia erecta*, B. M. t. 1340, *T. latifolia*, B. C. t. 1300, and *T. undata*, B. R. t. 1403.

Tine'a. A genus of moths, the larvae of which are very destructive.

T. dauce'lla. Carrot Moth. A synonym of *Depressaria dauce'lla*, which see.

T. pade'lla, Small Ermine Moth, is white, with black dots on the upper wings. Eggs deposited in June and July near the flower-buds of the hawthorn, euonymus, apple, and pear-tree. Caterpillars appear in autumn, and inclose the twigs with a web. In the following spring they attack the petals and calyx. Colour, dull lead, with a black head.

T. clercke'lla. Pear-tree Blister Moth. The caterpillars of this raise dark-brown blisters on the leaves of the pear-tree, and less often on those of the apple. The moth is active and minute, shining like pearly satin, the wings having an orange ground, spotted with black and other colours. It appears in May. Mr. Curtis says, "To check this disease, it will be advisable to wash the tree with soapsuds the end of May or beginning of June, when the moths are pairing and laying eggs for a future progeny; and if a very valuable tree be only partially attacked, the blistered leaves might be gathered and burnt as soon as any spots began to appear in August."

T. capite'lla. Triple-spotted Currant Tinea. The larvae of this feed upon the pith of the young shoots of the currant, which they attack in the spring. The moth itself is fuscous; the head with an ochreous tuft; superior wings bronzed, spotted with purple and yellow.

T. cortice'lla. See **Pyrus**.

T. porrecte'lla, Rocket, or Grey-streak Moth, has its habits and forms thus described by Mr. Curtis

During the middle and latter end of April, as the shoots of the rockets advance, it is found that the leaves adhere firmly together, and those that liberate themselves are perforated with large holes. On forcibly opening a shoot (for the young leaves are connected by silken threads), a small green caterpillar of different shades, varying with its age, is found in or near the centre, feeding upon the tender leaves, and sometimes a little family of four or five inhabit the same head. The head, feelers, and horns of our little moth are white, the latter with a few black spots near the tip; the thorax is cream-coloured, the sides brown, upper wings lance-shaped, very pale clay brown, with whitish streaks. Perhaps the best mode of extirpating them would be to search for the young caterpillars between the leaves on the first symptoms of their presence, and extracting them with a small pair of forceps, such as are used for microscopic objects; but as some might be too minute at that early period to be detected on the first search, this operation must be repeated. Pinching the maggots in the bud is also recommended.

Tinnea. (In honour of *Mademoiselle Tinné*, Nile voyager. Nat. ord., *Labiata*; Tribe, *Ajugoidæ*.)

Stove plant. For cultivation, see PLECTRANTHUS.

T. æthiopicæ. Maroon. Central Africa. 1867. Violet-scented. B. M. t. 5637.
— *dentata*. A variety with a large calyx. 1884. B. M. t. 6744.

Tipula. Crane Fly, or Daddy-long-legs. *T. oleracea*, the grubs, or "leather-jackets," so injurious to the market-gardener, are its larvæ. They attack the roots of scarlet beans, lettuces, dahlias, potatoes, etc., from May to August. During this last month and September they become pupæ. Mr. Curtis observes, that it is said that lime-water will not kill them, and suggests that if quick-lime were scattered on the ground at night, it would destroy them when they come to the surface to feed. All the gnats that are found on the walls, palings, ground, or elsewhere, should be killed, especially the female, which would prevent any eggs being deposited in the ground. A mixture of lime and gas-water, distributed by a watering-pot over grass, has completely exterminated the larvæ where they had been exceedingly destructive; and by sweeping the grass with a bag-net, like an angler's landing-net, only covered with canvas, immense numbers of the gnats might be taken and destroyed.

Tithonia. (From *Tithonus*, in mythology, the favourite of Aurora. Nat. ord., *Compositæ*; Tribe, *Helianthoidæ*. Allied to *Helianthus*.)

Stove, yellow-flowered annuals from Central America. Propagated by seeds. Rich, sandy, fibry loam. Winter temp., 50° to 55°; summer, 60° to 80°.

T. excoleta. August. 1824.

— *ovata*. B. M. t. 3901. See *Zexmenia ovata*.

Tithymalus. (From *Tithumalos*, the Greek name for the Spurge, *Euphorbia*. Nat. ord., *Euphorbiaceæ*.) A synonym of **Euphorbia**.

T. geniculata. A synonym of *Euphorbia repanda*.

— *pendulus*. A synonym of *Euphorbia pendula*.

Tittmannia. (After *J. A. Tittmann*, an apothecary of Hanover. Nat. ord., *Scrophularinæ*; Tribe, *Gratiolææ*.) A synonym of **Vandelia**.

T. ovata. See *Vandelia crustacea*.

— *viscosa*. See *Vandelia hirsuta*.

Toad Flax. *Lina'ria*.

Toad Flax, Ivy-leaved. *Lina'ria Cymbala'ria*.

Toad Flower, African. *Stape'lia*.

Toad Stool. A general name for poisonous fungi of the order *Hymenocetes*.

Tobacco (*Nicotia'na*), whether in the form of snuff, or its decoction in water, or its smoke whilst burning, is very destructive to insects.

Tobacco-paper is paper saturated with the decoction of tobacco, and when burnt emits a fume nearly as strong. It is an easy mode of generating the smoke. Whenever plants are smoked they should be done on two following nights, and then be syringed the following morning. Mr. Cameron says:—I have always found tobacco-paper the most efficacious substance to fumigate with for destroying the aphid without doing any injury to the plants. If the house is not filled too rapidly with smoke, which is allowed to reach the glass without coming in contact with any of the plants, it then descends as it cools, without doing any injury. Plants fumigated in frames, or under hand-glasses, are most liable to be injured by the heat of the smoke, if the operation is not done cautiously. There is a spurious kind of tobacco-paper sometimes offered in spring by the tobacco-nists, apparently made to meet the in-

creased demand, and this kind of paper will bring the leaves off plants, without killing many of the aphides. It is of a lighter colour than the genuine sort, and may be readily detected by the smell being very different. Foliage should be perfectly dry when a house is fumigated, and should not be syringed till next morning. If plants are syringed immediately after fumigation, many of the aphides will recover even when they have dropped off the plants, a fact which any one may soon prove after fumigating a house.

Another very simple mode of fumigating plants in frames, and under hand-glasses turned over them for the purpose, is as follows:—"Dissolve a table-spoonful of saltpetre in a pint of water; take pieces of the coarsest brown paper, six inches wide and ten inches long, steep them thoroughly in the solution, dry them, and keep till wanted. To fumigate, roll one of the pieces into a pipe like a cigar, leaving the hollow half an inch in diameter, which fill with tobacco, twist one end and stick it into the soil, light the other, and it will burn gradually away for an hour or more."

Tobacco-smoke should not be admitted to fruit trees when in bloom, nor when the fruit is ripening, as it imparts to them a flavour. See **Fumigating and Fumigator.**

Tobacco-water is usually made from what is known as *Tobacconists' Liquor*, being a liquor expressed by them, and full of ammonia and the acrid oil of the plant. To every gallon of this add five gallons of water. This mixture with Read's garden-syringe may be sprinkled over the trees, putting it on with the finest rose, and being careful to wet all the leaves. This operation is to be performed only in the hottest sunshine, as the effect is then much greater than when the weather is dull; five gallons of liquor reduced as above stated will cleanse seventeen peach and nectarine-trees, averaging seventeen feet in length, and twelve in height. The black, glutinous *aphis*, provincially called blight, so destructive to the cherry-trees, and, in fact, every species of *aphis*, is destroyed in the same way with equal facility. The grubs which attack the apricot may be destroyed almost instantly by immersing the infested leaves in this liquor.

As the tobacconist's liquor cannot be obtained always, tobacco-water may be, in such case, made by pouring half a gallon of boiling water upon one ounce of strong tobacco, and allowing it to remain until cold, and then straining.

Tobacco, Rock. *Primul'na Tabacum.*

Toco'ca. (From the Guianese name of *T. guianensis*. Nat. ord., *Melastomaceæ*; Tribe, *Miconiaceæ*.)

Stove shrubs, natives of the northern part of South America. Peat mixed with half the quantity of sandy loam. Cuttings of side shoots, taken early in the year.

- T. ferrug'nea*. South America. 1868. Syn., *Sphærogyne ferruginea*.
— *guianensis*. 4. Pale pink. August. Guiana. 1826.
— *imperialis*. Peru. 1869. Syn., *Sphærogyne imperialis*.
— *latifolia*. Pink or red. South America. 1862. Syn., *Sphærogyne latifolia*.

Tocoy'na. (Name in Guiana. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*. Allied to *Posoqueria*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sandy soil, under a glass, in heat, in May; fibry peat, a little lumpy loam, sand, and charcoal. Winter temp., 50° to 60°; summer, 60° to 85°.

- T. longifo'ra*. 6. Yellow. Guiana. 1826.

Todda'lia. (From *Toddali*, the Malabar name of *T. aculeata*. Nat. ord., *Rutaceæ*; Tribe, *Zanthoxyloæ*. Allied to *Ptelea*.)

Stove, white-flowered evergreens. Cuttings of young, stubby side-shoots in sand, under a glass, in April, in a sweet bottom-heat; fibry loam and a little peat or leaf-mould. Winter temp., 50° to 60°; summer, 60° to 80°.

- T. aculeata*. 6. E. Indies. 1790. Syn., *Scopolia aculeata*.
— *angustifo'lia*. 6. Mauritius. 1824.
— *lanceolata*. 4. White. May. 1824. Syn., *Vepris lanceolata*.
— *paniculata*. 30. Greenish-white. May. 1824.

Toddy Palm. *Caryota u'rens*.

To'dea. (Named after *H. J. Tode*, a German student of Ferns. Nat. ord., *Filices*. Allied to *Osmunda*.)

Greenhouse, brown-spored ferns. See **FERNS**.

Tolu Balsam-tree. *Myroxylon Toluiferum.*

Tomato. *Lycopersicon esculentum.* See Love Apple.

Tomato, Cannibal's. *Solanum anthropophagorum.*

Tomato disease. This disease is caused by *Peronospora infestans*, the same fungus that causes the **Potato disease**, to which refer for its history.

Tonga Plant. *Epipremnum mirabile.*

Tongue Grafting. See **Grafting.**

Tongue Grass. *Lepidium sativum.*

Tongue Violet. *Schweiggeria pauciflora.*

Tonquin Bean. *Dipterix odorata.*

Tool-house. Upon this too-neglected garden edifice, Mr. Barnes, of Bicton Gardens, says:—"Have a place for everything, and everything in its place; kept in good condition, and at all times put away clean; it will be found necessary to have a set of rules drawn up, and hung in a conspicuous place in the tool-house, which should be rigidly enforced, as well for the workman's benefit, as for the good preservation of the tools. Dirty tools engender slovenly habits, and inferior workmanship. The tool-shed of the outhouse and flower-garden department is a lean-to shed at the back of a hot house, substantially

built, and covered with slate; length, fifty-four feet; width, thirteen feet; height at back, fifteen feet; and height at front, nine feet; paved all through with Yorkshire flag-stones, which are neatly swept up every night, the last thing, and washed thoroughly once a week. There is a door at each end, and one in the centre of the front wall, and a window on each side of the centre door. Strong beams are thrown across from front to back, and strong planks laid on them, which form a useful loft for placing mats, stakes, laths for tally-making, brooms, nets, canvas for covering and shading, etc., etc. Within two feet of the roof, against the back wall, is placed a row of pegs the whole length of the shed, for hanging the long-handled tools, such as grass and leaf rakes, long-handled Dutch hoes, and iron rakes, etc.; on the next row of pegs, the whole length of the shed, are placed the various kinds of draw hoes, tan forks, dung forks and prongs, strong forks for digging and surface-stirring, spades and shovels of various kinds, pickaxes, mattocks and bills, dung drags, edging shears, etc.; on a third row of pegs, still lower, are placed the water-pots, all numbered, with initials as well, thus—B, G—45, or 60, whatever the number may run to; underneath those is a row more of pegs, for placing the roses of the water-pots—thus the back wall is furnished. The front wall, half-way, is furnished with shelves for placing shreds and nails, rope yarn, tallies, flower-pegs, whetstones, rubber or scythe-stones, and many other small articles. Underneath those shelves are pegs for hanging the hammers, axes, saws, hatchets, mallets, and stake-drivers, trowels, hand-forks, reels and lines, hedge-clipping shears, scythes, chisels, the various sizes of one-handed crane-necked hoes, crowbars, mops, hair-brushes, and brooms, and various other articles. The scythes are hung up over the end beam, and on the other side, without shelves, the hand-barrows are placed; birch and heath brooms, both round and fan-shaped, that are in daily use; and various other articles. The garden rules are hung in a conspicuous place; also in the tool-house. Every tool is to be put into its proper or allotted place every night thoroughly cleansed, any omission of which subjects the defaulter to a fine. Each tool-house is under the same system. We have separate wheelbarrow sheds; sheds for placing soils in the dry, arranged in old casks; varieties of sand, pebbles, and flints, for potting purposes, with lofts over for

flower-pot stowage; a shed for the liquid-manure casks, which is one of the most essential and valuable of all. A shed for placing the charred articles of all kinds, equal to the last; a potting shed; mushroom shed; stove shed; fruit rooms, and onion lofts, etc., etc. Each and all are kept under the same regulations."

Tooth-ache-tree. *Zanthoxylum*.

Toothwort. *Dentaria*.

Top-dressing. Manure spread over the surface whilst the crop is growing.

Torch Lily. *Kniphofia*.

Torch-Thistle. *Cereus*.

Tore'nia. (Named after Rev. O. Tore'n, a Swedish botanist. Nat. ord., *Scrophulariaceæ*; Tribe, *Gratioleæ*.)

Stove evergreens. Cuttings of the points of shoots, or small side-shoots, in sandy soil, and in a little heat; if far enough from the glass of the frame or pit, they will want no bell-glass; fibry loam and sandy peat in equal proportions, with another part made up of dried old cow-dung, charcoal, and rough sand. Winter temp., 42° to 50°; summer, 60° to 80°.

Tortoise Plant. *Testudina'ria*

elephantipes.

To'rtrix. A genus of moths.

T. lusca'na generates a red grub, and

T. cynosbana a black-spotted, green grub,

both very destructive of blossom-buds.

T. vitisa'na. Vine Tortrix. Found

on the vine in April and May; head

yellow; upper wings marbled with rusty

and grey colours. Caterpillars appear

as the blossom-buds open, which they

unite with white thread.

T. nigrica'na. Red Plum Grub Tortrix.

Moth black, appearing in June.

Eggs deposited on the plum; grub small,

red, pierces the fruit, and is found near

the stone. Mr. Curtis observes that,

"If the plums that have fallen off be

examined, a small red caterpillar will be

found within them; the caterpillar being

generally full grown when the plum falls

off, soon creeps out, and penetrates the

loose bark, forming a case, in which it

remains during the winter. Early in

the spring it changes into a light brown

pupa, and the moth emerges about June.

The moth is not so large as a house fly;

its wings are almost black, and when

the sun is shining on them they have a

remarkably metallic lustre; on the outer

edge of the fore-wings there is an appearance

of fine silver dust. Among the remedies

proposed to lessen the ravages of this

insect, it is recommended to shake the

trees and remove all the fruit that

falls off; and another good method is

to scrape the rough pieces of bark off

the stem under which the cocoons are

concealed: this must be done late in

the autumn, or early in the spring."

T. Bergmannia'na. Rose Tortrix.

Differs little to a common observer from

the preceding. Where bushes are much

infested with the larvæ of these insects,

it is much better to cut them down, and

burn the shoots. This and hand-picking

are the only remedies we are acquainted

with. Care must be taken not to disturb

the maggots when collecting them, for

they will let themselves down with

threads, and thus escape.

T. ocella'na. This is the parent of the

red-bud caterpillar, which destroys the

buds of the apple and pear. Upper

wings grey, with a white transverse

band.

T. Waerberia'na. Plum-tree Tortrix.

Its larva feeds on the inner bark of the

plum, apricot, almond, and peach. The grubs pierce holes through the bark, which may be detected by small heaps of red powder upon it. Moth brown; grub greenish, with a red head.

T. Pomona'na. Codling Moth. Its reddish-white grub is common in apples and pears. Moth light grey, streaked with dark grey. Seen in the evening during May, and the grubs appear soon after. All fallen apples should be destroyed, because they usually contain this or other grubs, which will otherwise produce moths, and multiply the evil.

T. turion'na, *T. hyrcynia'na*, *T. resinella*, and *T. buolia'na*, all infest pine-trees, injuring them by depositing their eggs in the buds, which are subsequently preyed upon by their caterpillars.

Tota'ra Pine. *Podocarpus Tota'ra*.

Touch-me-not. *Impatiens*.

Tournefortia. (Named after J. P. Tournefort, a great systematic botanist. Nat. ord., *Boraginæ*; Tribe, *Heliotropiæ*. Allied to the Heliotrope.)

Cuttings of young shoots in April or August, in sandy soil, under glass, and in a little heat. Some, such as *heliotropioides*, make a fair bed out of doors; except for this purpose, they are not worth house room either in a greenhouse or a plant-stove; any light, common soil suits them, and they may be planted out in the middle of May.

GREENHOUSE EVERGREENS.

- T. cordifolia*. White. Tropical America. 1887. Rev. Hort. 1887, p. 123, figs. 26-7.

Tourretia. (After Marc Ant. Claret de la Tourrette, 1729-1793, a botanical author. Nat. ord., *Bignoniaceæ*.)

Hardy climbing herb. Seeds sown early in spring in a hotbed, the seedlings transplanted when large enough.

T. lappa'cea. 6. Violet-purple. July. Alpine Tropical America. 1788. B. M. t. 3749.

Tova'ria. (Derivation unexplained. Nat. ord., *Liliacæ*; Tribe, *Polygonacæ*. Allied to *Convallaria*.) A synonym of **Smilacina**.

T. oleracea. 4. White. Sikkim. 1877. A synonym of **SMILACINA OLERACEA**.

Tovomi'ta. (*Tovomite*, the name in Cayenne. Nat. ord., *Guttiferæ*; Tribe, *Clusiææ*.)

Stove evergreen trees. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat; sandy peat and fibry loam. Winter temp., 58° to 65°; summer, 65° to 90°, and moist atmosphere.

T. Choisya'na. 10. Yellow. May. Cayenne. 1823. Syn., *T. clusiæfolia* and *Micranthera clusiæfolia*.

— *fructipendula*. 18. Yellowish. January. Peru. Syn., *Beauharnoisia fructipendula*.

— *guianensis*. Green. Guiana. 1827. Syn., *Mariaba guianensis*.

Town Cress. *Lepidium sativum*.

Toxicodendron. (From *toxicon*, poison, and *dendron*, tree; the fruits are poisonous. Nat. ord., *Euphorbiacæ*.)

Small much-branched greenhouse tree or shrub. Propagated by cuttings, in sand, under a bell-glass.

T. capense. 6. June. South Africa. 1783. Syn., *Hyacinthine globosa*.

Toxicophlæ'a. (From *toxicon*, poison, and *phloios*, bark. Nat. ord., *Apocynaceæ*; Tribe, *Plumeriææ*.)

Greenhouse trees or shrubs. Soil rich and light. Cuttings.

T. cestroides. A synonym of *Acokanthera venenata*.

— *spectabilis*. See *Acokanthera spectabilis*.

— *Thunbergii*. See *Acokanthera venenata*.

Trachelium. Throatwort. (From *trachelos*, the neck; supposed efficacy in diseases of the trachea. Nat. ord., *Campanulacæ*; Tribe, *Campanuleæ*.)

Hardy herbaceous perennial. Seeds in a slight hotbed in spring; also by cuttings of young shoots in sandy soil, in April, or at the end of summer; sandy loam and a little vegetable mould.

T. cæruleum. 2. Blue. August. Italy. 1640. B. R. t. 72.

— *album*. A white-flowered variety.

Trachelospermum. (From *trachelos*, the neck, and *sperma*, a seed; the seeds are elongated at one end. Nat. ord., *Apocynaceæ*.)

Evergreen climbers, requiring greenhouse treatment. Grow in a compost of loam and peat, and propagate by cuttings in sand under a bell-glass.

T. jasminoides. White. July. China. 1846. Syn., *Rhynchospermum jasminoides*. B. M. t. 4787.

— *variegatum* and *R. varium* are forms of this.

— *angustifolium*. Leaves narrower than in the type. Syn., *Trachelospermum angustifolium*.

Trachycarpus. (From *trachys*, rough, and *karpos*, fruit; probably in allusion to the hairs upon the fruit. Nat. ord., *Palmeæ*; Tribe, *Coryphecæ*.)

Greenhouse or half-hardy palms. Allied to **CHAMÆROPS**, to which refer for cultivation.

T. excelsus. 29. Yellow, green. July. China. 1844. Syn., *T. Fortunei* and *Chamærops Fortunei*. B. M. t. 522A.

- T. Fortu'nei*. See *T. excelsus*.
 — *Griffithii*. See *T. khasyanus*.

 — *Martiana*. See *T. khasyanus*.

Trachylobium. (From *trachys*, rough, and *lobos*, pod. Nat. ord., *Leguminosæ*; Tribe, *Amhersticæ*.)

Stove evergreen tree. For culture, see HYMENÆA.

- T. verrucosum*. 20. White. Madagascar. 1808. Syns., *T. Martianum* and *Hymenæa verrucosa*.

Trachyme'ne. (From *trachys*, rough, and *hymen*, a membrane; channels of the fruit. Nat. ord., *Umbelliferae*; Tribe, *Hydrocotyleæ*.)

All the following are greenhouse, Australian evergreen plants, except *cærulea*. The annuals never do much good in the open air, however raised; but if sown in a gentle hotbed in March, pricked out and potted, and flowered in the greenhouse in summer, they will reward the trouble; sandy loam and leaf-mould; shrubs, cuttings of young shoots under a bell-glass, in sandy soil; sandy loam and fibry peat. Winter temp., 40° to 50°.

- T. cærulea*. 1½. Blue. July. 1827. Annual. Syn., *Didiscus cæruleus*. B. M. t. 2875.
 — *compre'ssa*. 1. Pale yellow. May.

 — *linearis*. 2. Yellow. July. 1824.
 — *ovata*. 1. White. May.
 — *ovata*. 1. Pale yellow. May.

Trachystemon. (From *trachys*, rough, and *stemon*, a thread; in allusion to the hairy filaments of the stamens. Nat. ord., *Boraginaceæ*; Tribe, *Borageæ*. Allied to *Anchusa*.)

Hardy herbaceous perennials. Seeds; divisions in spring. Ordinary garden-soil.

- T. creticum*. 1. Blue. May. Crete. 1823. Syn., *Borago cretica*.
 — *orientalis*. 2. Blue. Spring. Levant. 1752. Syn., *Borago orientalis*. B. M. t. 288.

Tradescantia. Spiderwort. (Named after *J. Tradescant*, gardener to Charles I. Nat. ord., *Commelinaceæ*; Tribe, *Tradescantieæ*.)

All blue-flowered, except where otherwise mentioned. Annuals, by seed; perennials, by divisions in spring; rich, light loam; those requiring the greenhouse and stove will thrive better from having a little peat, and they should be well drained.

HARDY ANNUALS.

— *polyganum*. 2. Pink. July. Carolina. 1810.

Trailers. See **Creepers**.

Train Oil. See **Animal Matters**.

Training has for its object the rendering plants more productive either of flowers or of fruit, by regulating the number and position of their branches. If their number be too great they overshadow those below them, and, by excluding the heat and light, prevent that elaboration of the sap required for the production of fructification. If they are too few the sap is expended in the production of more, and in extending the surface of the leaves required for the development of the juices.

The position of the branches is important, because, if trained against a wall, they obtain a higher temperature and protection from winds; and if trained with their points below the horizontal line the return of the sap is checked. Shy-flowering shrubs, as *Mimus glutinosus*, var. *punicus*, are made to blossom abundantly, and freely-flowering shrubs, as *Cytisus hybridus*, are made to blossom earlier, by having their branches bent below the horizontal line.

The reason of this appears in the fact, that a plant propels its sap with greatest force perpendicularly, so much so that the sap rising in a vine branch growing in a right line from the root, with a force capable of sustaining a column of mercury twenty-eight inches high, will, if the branch be bent down to a right angle, support barely twenty-three inches, and if bent a few degrees below the horizontal the column sustained will not be more than twenty-one inches.

This is the reason why, at such angles, gardeners find the trained branches of their wall-trees rendered more produc-

tive of blossoms, and furnished with a smaller surface of leaves. A similar effect is produced by training a branch in a waving form, for two-thirds of its length are placed horizontally, as in the accompanying outline.

Besides the usual modes of training—for which see also **Espaliers** and **Standards**—there are two other modes which deserve notice.

Quenouille Training consists in training one upright central shoot in summer, and shortening it down to fifteen inches at the winter pruning, in order that it may, at that height, produce branches forming a tier, to be trained, in the first instance, horizontally. The shoot produced by the uppermost bud is, however, trained as upright as possible during the summer, and is cut back, so as to produce another tier fifteen inches above the first, and so on until the tree had reached the desired height. In this climate it is necessary to train the shoot downwards, which is easily done by tying those of the first tier to short stakes, those of each successive tier being fastened to the branches below them. When the shoots are thus arched downwards at full length, or nearly so, they soon come into a bearing state; but in this climate, if cut short, as the French do, they only send up a number of shoots annually. The plan answers very well where it can be at all times properly attended to; but if this cannot be guaranteed, the ordinary form of dwarf is preferable. Quenouilles require more time to be devoted to them than espaliers.

Balloon Training is forcing downwards all the branches of standard trees till the points touch the earth, and they have the merit of producing large crops of fruit in a very small compass. Their upper parts are, however, too much exposed to radiation at night, and the crop from that part of the branches is apt to be cut off.

Trama auriculae. This Aphis attacks the roots of the Auricula, and oftentimes causes serious damage to the plants. In colour the insect is greenish-white, some individuals being furnished with a woolly excretion behind (our illustration represents this form magnified), others being without it; the legs and antennae are brownish. When Auriculas are found to be attacked by the Trama, which may be known by their unhealthy appearance and the presence of white

woolly matter about the collar and roots, the infected plants should be thoroughly cleansed of the earth, and their roots, etc., well cleaned with soft soap, and then repotted in fresh soil and clean pots; the earth and pots in which they grew should be scalded to kill any insects or eggs that may remain in it. The repotted plants should be placed in a fresh place, to prevent their being again attacked by any stray Tramas that may lurk in the neighbourhood where the infected plants stood.

Transplanting is most successfully performed whenever the roots are least required for supplying the leaves with moisture. The reason is obvious, because the roots are always in some degree broken, and lessened in their absorbing power, by the process of removal. That such is the *rational* of seasonable transplanting is proved by the fact, that plants in pots, with reasonable care, may be transplanted at any season. This rule, too, is sanctioned both by theory and practice—transplant as early as possible after the leaves cease to require a supply of sap; the reason for which is, that the vital powers in the roots continue active long after they have become torpid in the branches, and fresh roots are formed during the autumn and winter to succeed those destroyed by transplanting.

For transplanting most *deciduous* trees and shrubs October and November are the most successful months. In transplanting *evergreens*, Mr. Beaton says:—"I do not now concur in the general belief that autumn is the best time to plant all kinds of evergreens *indiscriminately*. I have planted evergreens every week in the year, more from necessity than choice it is true, but still the result of the whole convinces me that a dogmatic adherence to this or that given period of the year is just as bad and unphilosophical as the old prejudice in favour of planting all kinds of evergreens late in the spring. That vast assemblage of evergreens belonging to the natural order *Coniferae*, from the Cedar of Lebanon down to the trailing Juniper, should be planted from the middle of July to the beginning of October, according to the weather after St. Swithin's day. November, on the other hand, is as good a time as can be to remove evergreens of all kinds, provided that large balls of earth be removed with them. *Hollies*, *Laurestinus*, *Alaternus*, *Phillyreas*, and *Tree Box* will transplant as well in May and June as at any other time of the year—that I am quite certain; I have removed hundreds of

them in May and June without losing a twig. On the other hand, all these, and many more besides, will answer as well if planted early in November; but that is no reason for giving up the old plan of late spring planting such evergreens as do well at that time, although we need not do so from choice. The whole question amounts to this:—All evergreens succeed if planted in the autumn; a great number of them will do better from being planted in the autumn, and will not transplant safely except in the autumn; while a large portion of them may be planted every day in the year with almost equal success."

November and May are the best two months to *remove Roses*. All the young and tender ones in pots turn out in May; but for all those on their own roots November is the best month to remove them.

Tra'pa. Water Caltrops. (From *calceitrapa*, an ancient instrument in warfare with four spikes; fruit armed with spikes, or horns. Nat. ord., *Onagrarieae*.)

Aquatics. Seeds; good loam, in a tub or pond of water; *T. na'tans* will do in the latter; the others require the shelter of a greenhouse.

T. bico'rnis. White. July. China. 1790. Greenhouse perennial.

—*bispino'sa*. White. July. E. Ind. 1822. Greenhouse biennial.

—*na'tans*. White, purple. July. Europe. 1781. Hardy annual.

—*quadrispino'sa*. White. July. E. Ind. 1823. Greenhouse biennial.

—*verbanensis*. Lake Maggiore. 1886. Hardy.

Trautvette'ria. (After Ernest R. Trautvetter, a Russian botanist. Nat. ord., *Ranunculaceae*; Tribe, *Ranunculaceae*.)

Hardy perennial. Divisions. Ordinary garden-soil.

T. palma'ta. 2-3. White. July. North America and Japan. 1812. Syn., *Actaea palmata*.

This is the correct name for the plant described on p. 222 as *Cimicifuga palmata*.

Travellers' Joy. *Cle'matis vitalba*.

Travellers' Tree. *Ravenna'la madagascariensis*.

Treasure Flower. *Gaza'nia*.

Trecu'lia. (Named in honour of M. Auguste Trécul, a botanist. Nat. ord., *Urticaceae*; Tribe, *Artocarpeae*. Allied to *Artocarpus*.)

Stove evergreen tree. Cuttings of the ripened shoots in sandy loam, in bottom heat and under a bell-glass. Rich loam and leaf-mould. Summer temp., 65° to 85°; winter, 60° to 70°. Moist atmosphere.

T. africa'na. Greenish. W. Tropical Africa. 1872. B. M. t. 5986.

Tree Carrot. *Monizia c'dulis.*

Tree Celandine. *Bocc'onia frute'-scens.*

Tree Guards. The following are cheap and effectual:—Stakes about the thickness of the wrist, seven feet in length, and tolerably straight, each chopped a little flat on one side, some iron hooping, a little thicker than coopers are in the habit of using for barrels, with punched holes through it six inches apart, with one hole near each end. Nail this to the stakes on the chopped side, one foot from the top of them, and one foot from the bottom; then raise it, and bend it circularly round the tree, observing that the hoops are placed inside, nearest the tree; the holes left at each end of the hoop are then clenched up with a nail, and the guard is complete.

The following plan is somewhat similar:—Procure stakes of ash or larch, six feet in length, or more if requisite, and about two inches in diameter, and bore holes through the tops and bottoms about one foot from each end. Get a similar hole drilled up the centre of a stake, and saw it off in lengths of two inches, or rather less; pass a strong wire, or thick tarred string, through one stake, by the holes at the top and at the bottom; then pass it through the hole made in one of the two-inch pieces at each end, and then through another stake, separating each stake at top and bottom by a piece of wood, until you leave enough to surround the tree loosely, leaving plenty of space for growth. Place it round the tree, and fasten the ends of the wire or string. This guard is much the same as a cradle put round the neck of a blistered horse, to prevent his gnawing the irritated part. The stakes merely rest on the ground, and should be cut quite flat at the bottom, to prevent their sticking into the ground. At the upper end they should have a sharp slanting cut with a bill-hook, and threaded with the slope towards the tree. The motion of the tree will not in any degree be impeded; and the bark cannot be injured let the wind blow as it may, for the guard moves freely with the tree in every direction.

Trees are the chief material in landscape gardening. The varieties in their shapes, says Mr. Whately, may be reduced to the following heads: Some, thick with branches and foliage, have almost an appearance of solidity, as the beech, the elm, the lilac, and seringa; others, thin of boughs and of leaves, seem light and airy, as the ash and the

abele, the common arbor vitæ and the tamarisk.

There is a mean betwixt the two extremes, very distinguishable from both, as in the bladder-nut and the ash-leaved maple. They may again be divided into those whose branches begin from the ground, and those which shoot up in a stem before their branches begin. Trees which have some and not much clear stem, as several of the firs, belong to the former class; but a very short stem will rank as a shrub, such as the althæa, in the latter.

Of those, the branches of which begin from the ground, some rise in a conical figure, as the larch, the cedar of Lebanon, and the holly. Some swell out in the middle of their growth and diminish at both ends, as the Weymouth pine, the mountain ash, and the lilac; and some are irregular and bushy from the top to the bottom, as the evergreen oak, the Virginian cedar, and Guelder rose. There is a great difference between one whose base is very large, and another whose base is very small, in proportion to its height. The cedar of Lebanon and the cypress are instances of such a difference; yet in both the branches begin from the ground.

The heads of those which shoot up into a stem before their branches begin sometimes are slender cones, as of many firs; sometimes are broad cones, as of the horse-chestnut; sometimes they are round, as of the stone pine, and most sorts of fruit-trees; and sometimes irregular, as of the elm. Of this kind there are many considerable varieties.

The branches of some grow horizontally, as of the oak; in others they fall, as in the lime and the acacia; and in some of these last they incline obliquely, as in many of the firs; in some they hang directly down, as in the weeping willow.

Some are of a dark green, as the horse-chestnut and the yew; some of a light green, as the lime and the laurel; some of a green tinged with brown, as the Virginian cedar; some of a green tinged with white, as the abele and the sage-tree; and some of a green tinged with yellow, as the ash-leaved maple and the Chinese arbor vitæ. The variegated plants, also, are generally entitled to be classed with the white or the yellow, by the strong tincture of the one or the other of those colours on their leaves.

The fall of the leaf is the time to learn the species, the order, and the proportion of tints, which blended will form

beautiful masses ; and, on the other hand, to distinguish those which are incompatible near together. The peculiar beauty of the tints of red cannot then escape observation, and the want of them throughout the summer months must be regretted ; but the want, though it cannot perfectly, may partially be supplied, for plants have a permanent and an accidental colour. The permanent is always some shade of green, but any other may be the accidental colour ; and there is none which so many circumstances concur to produce as a red. It is assumed in succession by the bud, the blossom, the berry, the bark, and the leaf. Sometimes it profusely overspreads, at other times it dimly tinges the plant, and a reddish-green is generally the hue of those plants on which it lasts long or frequently returns.

Admitting this, at least for many months in the year, among the characteristic distinctions, a large piece of red-green, with a narrow edging of dark green along the further side of it, and beyond that a piece of light green still larger than the first, will be found to compose a beautiful mass. Another, not less beautiful, is a yellow-green nearest the eye, beyond that a light green, then a brown-green, and lastly a dark green. The dark green must be the largest, the light green the next in extent, and the yellow-green the least of all.

From these combinations the agreements between particular tints may be known. A light green may be next either to a yellow or a brown-green, and a brown to a dark green, all in considerable quantities ; and a little rim of dark green may border on a red or a light green. Further observations will show that the yellow and the white-greens connect easily ; but that large quantities of the light, the yellow, or the white-greens do not mix well with a large quantity also of the dark green ; and that to form a pleasing mass, either the dark green must be reduced to a mere edging, or a brown or an intermediate green must be interposed ; that the red, the brown, and the intermediate greens agree among themselves, and that either of them may be joined to any other tint ; but that the red-green will bear a larger quantity of the light than of the dark green near it ; nor does it seem so proper a mixture with the white-green as with the rest. In massing these tints an attention must be constantly kept up to their forms, that they do not lie in large stripes one beyond

another ; but that either they be quite intermingled, or, which is generally more pleasing, that considerable pieces of different tints, each a beautiful figure, be in different proportions placed near together. See **Clump, Avenue, and Grove.**

Tree Mallow. *Lava'tera arbo'rea.*

Tree of Heaven. *Aila'nthus.*

Tree of Life. *Thu'ya.*

Tree of Sadness. *Nycta'nthes arbor tri'stis.*

Tree or Canada Onion. (*Allium proli'ferum.*) This is without a bulbous root, but throws out numerous offsets. Its top bulbs are greatly prized for pickling, being considered of superior flavour to the common onion.

It is propagated both by the root-sets, which may be planted during March and April, or in September and October, and from the top bulbs, which are best planted at the end of April. The old roots are best to plant again for a crop of bulbs, as they are most certain to run to stems. Plant in rows twelve inches asunder, in holes six inches apart and two deep, a single offset or bulb being put in each. Those planted in autumn will shoot up leaves early in the spring, and have their bulbs fit for gathering in June or the beginning of July. Those inserted in the spring will make their appearance later, and will be in production at the close of July or early in August. They must not, however, be gathered for keeping or planting until the stalks decay, at which time, or in the spring also, if only of one year's growth, the roots may be taken up and parted if required for planting ; but when of two or three years' continuance, they must, at all events, be reduced in size, otherwise they grow in too large and spindling bunches ; but the best plan is to make a fresh plantation annually with single offsets.

The bulbs, when gathered, must be gradually and carefully dried in a shady place, and if kept perfectly free from moisture will continue in good state until the following May.

Trefoil, Shrubby. *Jasminum fruticosum* and *Ptelea trifoliata*.

Trellis, or Treillage, is an arrangement of supporters upon which to train plants.

Espalier Trellis.—The cheapest, the easiest, and the soonest made is that formed with straight poles or stakes of ash, oak, or chestnut, in lengths of from five to six or seven feet, driving them in the ground in a range about a foot distant, all of an equal height, and then railed along the top with the same kind of poles or rods, to preserve the whole form in a regular position. They should be full an inch and a half thick, and, having pointed them at one end, drive them with a mallet into the ground in a straight range, close along the row of trees, a foot deep at least. To render treillage still stronger, run two, three, or more ranges of rods along the back part of the uprights, a foot or eighteen inches asunder, fastening them to the upright stakes either with pieces of strong wire twisted two or three times round, or by nailing them.

Espalier trellis made of cast-iron rods is neater and much more durable than that made of wood.

Trellis for Climbers.—These have been greatly improved, or rather, they have been created within recent years.

Their forms are now various and elegant; but we shall here only explain the manner in which the wire trellis for climbing plants is attached to the pots. It will be seen that a strong wire ring is

carried round the pot a little above its bottom. To this a sufficient number of upright wires are attached all round. These upright wires are pressed down upon the surface of the pot till they reach the rim, over which they are firmly bent till they reach the highest point of the rim, or are even bent a little within it. At this point they are secured by a second ring of stout wire, adjusted as in the drawing, which

having been done, the uprights are directed upwards, and fashioned into the pattern required. By these means a sort of collar is formed upon the rim of the pot, which prevents the trellis from slipping downwards, while, at the same time, the lowest ring of wire keeps it from swinging and swaying backwards and forwards.

Umbrella Trellis is a form excellently adapted for *Wistaria sine'nsis*, and

other climbers or shrubs having long racemes of flowers.

Hothouse Trellis, for training vines near the glass, is usually made of thin rods of deal or of iron, placed about a foot apart, and fastened to the framework of the building. Mr. Long, Beaufort Place, Chelsea, has invented a movable wire trellis, by which the vines may be lowered from the roof, or placed at any angle, without injuring the vines. This is an excellent mode of removing them from the influence of extreme exterior heat or cold. A still further improvement would be to have the vertical rods movable round the rod horizontally fixed to the rafter or roof, for then the whole trellis might be raised to an angle with, or even close to, the glass, whenever sun to the vine upon the trellis, or shade to the plants within the house, was desirable.

Trema'ndra. (From *tremo*, to tremble, and *andros*, a male; the anthers vibrate with the least movement of the air. Nat. ord., *Trema'draea*.)

Small greenhouse shrubs from Australia, with purplish flowers. For cultivation, see TETRA-
THECA.

T. hirsuta. 1.

— *stelligera*. 1½.

— *verticillata*. See *Platytheca galioides*.

Trembling American Tree.
Populus tremula.

Trenching is one of the readiest modes in the gardener's power for renovating his soil. The process is thus conducted: From the end of the piece of ground where it is intended to begin take out a trench two spades deep, and twenty inches wide, and wheel the earth to the opposite end to fill up and finish the last ridge. Measure off the width of another trench, then stretch the line, and mark it out with the spade. Proceed in this way until the whole of the ridges are outlined, after which begin at one end, and fill up the bottom of the first trench with the surface or "top spit" of the second one; then take the bottom "spit" of the latter, and throw it in such a way over the other as to form an elevated sharp-pointed ridge. By this means a portion of fresh soil is annually brought on the surface in the place of that which the crop of the past season may have, in some measure, exhausted.

Bastard Trenching is thus performed:—Open a trench two feet and a half or a yard wide, one full spit, and the shovelling deep, and wheel the soil from it to where it is intended to finish the piece; then put in the dung, and dig it in with the bottom spit in the trench; then fill up this trench with the top spit, etc., of the second, treating it in like manner, and so on. The advantages of this plan of working the soil are, the good soil is retained at the top, an important consideration where the subsoil is poor or bad; the bottom soil is enriched and loosened for the penetration and nourishment of the roots, and, allowing them to descend deeper, they are not so liable to suffer from drought in summer; strong soil is rendered capable of absorbing more moisture, and yet remains drier at the surface by the water passing down more rapidly to the subsoil, and it insures a thorough shifting of the soil.

In all trenching, whether one, two, or more spades deep, always, previous to digging, put the top of each trench two or three inches deep or more, with all weeds and other litter at the bottom of the open one, which not only makes clean digging and increases the depth of loose soil, but all weeds and their seeds are regularly buried at such a depth, that the weeds themselves will rot, and their seeds cannot vegetate.

Trevesia. (After the *Treves de Bonfigli* of Padua, patrons of Botany. Nat. ord., *Araliaceæ*.)

Stove shrubs, or small trees with large leaves. Compost of sand, loam, and leaf-mould. Cuttings.

T. e'minens. Phillipine Islands. 1882.
— *palmeta.* 10. Greenish-white. March. India. 1818. Syns., *T. sundaica*, *Gastonia palmata*, B. R. t. 894, and *Gilbertia palmata*.

Trevo'a. (In honour of *Trevo*, a Spanish botanist. Nat. ord., *Rhamnææ*.) Greenhouse tree, rarely seen in cultivation.
T. trine'rvia. South America.

Tre'wia. (In honour of *C. J. Trew*, 1695-1769, author of a volume of illustrations of garden plants. Nat. ord., *Euphorbiaceæ*.)

Stove tree. Compost of sandy loam and peat. Cuttings, in sand, in heat, under a bell-glass.
T. nudifl'ora. 8. Greenish. May. East Indies. 1796.

Tria'nea. (Named in honour of *M. José Triana*, a botanist and traveller in Columbia. Nat. ord., *Hydrocharidaceæ*. Allied to *Hydrocharis*.)

Stove or greenhouse floating aquatic. See **AQUARIUM**.
T. bogote'nsis. Columbia. 1879. G. C. 1881, xv. p. 466; Gf. t. 980.

Tri'as. (From *treis*, three; in reference to the arrangement of the perianth segments. Nat. ord., *Orchidææ*; Tribe, *Epidendreaæ—Dendrobieæ*.)

Dwarf stove orchids. See **ORCHIDS**.
T. obso'nga. †. Greenish-brown; lip purplish. April. Moulmein. 1837.
— *pi'cta.* Honey-colour, spotted with reddish-purple. G. C. 1888, iii. p. 488.

Tibra'chia. (From *treis*, three, and *brachys*, short. Nat. ord., *Orchidææ*; Tribe, *Epidendreaæ—Dendrobieæ*.) A synonym of **Bulbophyllum**.

T. pe'n'dula. B. R. t. 963. See *Bulbophyllum recurvum*.

Tri'bulus. Caltrops. (From *treis*, three, and *ballo*, to project; carpels, or divisions of the seed-vessel, end in three or four projecting points. Nat. ord., *Zygophyllaceæ*.)

All yellow-flowered, and annuals, except *cistoïdes*. Sow in a hotbed in March, harden off, and put in a sheltered place in the garden towards the beginning of June, or flower in pots in the greenhouse; rich, light, sandy loam; a little peat will be required for *cistoïdes*, which is easily increased by cuttings in the spring.

Trichosa'cme. (From *thrix*, a hair, and *acme*, a point; referring to the corolla's hairy appendage. Nat. ord., *Asclepiadaceæ*; Tribe, *Gonolobæ*.)

Stove climber. All parts of the plant, except the corolla, are covered with a woolly felt. For cultivation, see STAPELIA.

- T. lana'ta*. Purple. Mexico. 1850. Paxt. Fl. Gard. i. p. 105, fig. 71.

Trichosa'nthes. Snake Gourd. (From *thrix*, a hair, and *anthos*, a flower; flowers fringed. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumerineæ*.)

Stove, white-flowered annuals. Seeds in a sweet hobbed in March, potted and grown in a plant-stove; sandy loam, leaf-mould, and fibry peat. The great length of the cucumber-like seed-vessel is interesting.

- T. angui'na*. 4. May. China. 1735. B. M. t. 722. Syn., *T. colubrina*.
 — *colubri'na*. B. R. 1846, t. 18. See *T. anguina*.
 — *faetidissima*. Jacq. Ic. t. 624. See *Rhynchoscarpa foetida*.
 — *japo'nica*. Greenish-white. Japan. 1872. Gf. t. 714.
 — *Kiril'owi*. See *T. vitifolia*.
 — *palma'ta*. July. E. Ind. 1825. B. M. t. 6873.
 — *vitifolia*. White; fruit large, orange-red. China. 1872. Syns., *T. Kirilowi* and *Eopepon vitifolius*.

Tricho'sma. Hair Orchis. (From *thrix*, a hair, and *kosmos*, ornament. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Cælogyneæ*.)

Stove orchid, grown in a basket. See ORCHIDS.
T. sua'vis. 1. White, yellow. June. Northern India. 1840. B. R. 1842, t. 21.

Trichoste'ma. (From *thrix*, a hair, and *stema*, a stamen; the filaments are slender. Nat. ord., *Labiataæ*.)

Hardy sub-shrub, requiring the same culture as SALVIA.

- T. Par'shii*. 1½. Bluish-purple. South California. 1882.

Trico'ryne. (From *treis*, three, and *koryne*, a club; form of the seed-pod. Nat. ord., *Liliaceæ*; Tribe, *Johnsoniæ*.)

Half-hardy, white-flowered, herbaceous perennials, from Australia. Division and seeds; rich, sandy loam; a very sheltered place, or a cold pit, or a cool greenhouse in winter.

- T. ela'tior*. 2. June. 1824.
 — *scabra*. 1. 1826.
 — *simplex*. 1. July. 1823. Biennial.

Trichoto'sia. See **Eria**.

Tricra'tus admira'bilis is a synonym of **Abronia umbellata**.

Tricuspidaria. (From *tricuspis*, three pointed; in allusion to the three-

toothed petals. Nat. ord., *Liliaceæ*; Tribe, *Sloaneæ*. Allied to *Aristolelia*.)

A very beautiful greenhouse shrub. We know nothing of its cultivation, but it will probably be found to thrive if treated in the same way as SPARMANNIA.

- T. hexape'tala*. Scarlet. Chili. 1880. Syn., *Crinodendron Hookerianum*.

Tricyrtis. (From *treis*, three, and *kyrtos*, convex; alluding to the three outer sepals having bags at their bases. Nat. ord., *Liliaceæ*; Tribe, *Uvulariæ*.)

Half-hardy bulb. Greenhouse or cold pit in winter. Offsets. Sandy loam and peat.

- T. elegans*. 1½. White, purple. China. 1860.
 — *hirta*. 4. White, purple. Japan. 1863. B. M. t. 5355.
 — *macro'poda*. Greenish-yellow, purple-dotted. Japan. 1869. B. M. t. 6544.
 — — *striata*. Leaves striped with white. Syn., *T. foliis albo-striatis*. Fl. Ser. t. 1820.
 — *pilo'sa*. 1. Green, red. Sikkim. 1851. B. M. t. 4955.

Tri'dax. (From *treis*, three, and *akis*, a point; the ray florets are three lobed. Nat. ord., *Compositæ*.)

Hardy, perennial herbs. Propagated by divisions or seeds.

- T. bi'color*, var. *rosea*. Rosy-lilac, yellow. Mexico. 1887.
 — *coronopifolium*. 1. Yellow. June. Mexico. Syn., *Ptilostephium coronopifolium*.
 — *triloba'tum*. 1. Yellow. June. Mexico. Syn., *Galinisoga trilobata*. B. M. t. 1895.

Trienta'lis. Wintergreen. (From *treis*, one-third; low growth. Nat. ord., *Primulaceæ*; Tribe, *Lysimachiæ*.)

Hardy, white-flowered, herbaceous perennials. Seeds under a hand-light; divisions of the plant in spring; light, rich soil. Pretty little plants, requiring a shady situation.

- T. america'na*. ½. July. N. America. 1816.
 — *europæ'a*. 1½. May. Britain. Eng. Bot. ed. 3, t. 1139.

Trifo'lium. Trefoil. (From *tres*, three, and *folium*, a leaf; three-leaved. Nat. ord., *Leguminosæ*; Tribe, *Trifoliceæ*.)

Seeds in the open ground, and divisions of the herbaceous perennials; light, rich loam.

HARDY HERBACEOUS.

- Trifu'rcia.** (From *treis*, three, and *furca*, a fork; the style is three-forked. Nat. ord., *Iridaceæ*.) A synonym of **Herbertia**.
T. cœrulea. See *Herbertia cœrulea*.
T. pulchella. See *Herbertia pulchella*.
- Trigo'chin.** Arrow Grass. (From *treis*, three, and *glochis*, a point; referring to the angles of the carpels. Nat. ord., *Naiadaceæ*.)
 Greenhouse, marsh herb.
T. Barrelieri. See *T. bulbosum*.
T. bulbosum. 1. Purplish. October. South Europe. 1806. B. M. t. 1445. Syn., *T. Barrelieri*.
- Trigo'ssum.** (From *treis*, three, and *glossa*, a tongue. Nat. ord., *Gramineæ*.) A synonym of **Arundinaria**.
- Trigone'lla.** Fenugreek. (From *treis*, three, and *gonu*, an angle; the flower has a somewhat triangular appearance. Nat. ord., *Leguminosæ*; Tribe, *Trifolieæ*.)
 Hardy, herbaceous annuals, except *T. ruthenica*, which is a perennial. Seeds. Ordinary garden-soil.
T. cœrulea. 1-2. White, blue. July. Switzerland. 1562. Syn., *Trifolium cœruleum*. B. M. t. 2283.
 — *Fœnum-Græcum*. 1-2. White. Summer. South Europe. Sibth. Fl. Gr. t. 766.
 — *ruthenica*. 1 $\frac{1}{2}$. Yellow. June. Siberia. 1759. B. C. t. 1391.
- Trigo'nia.** (From *treis*, three, and *gonu*, an angle; the fruit three-angled. Nat. ord., *Vochysiaceæ*.)
 Stove evergreens. Cuttings of half-ripened shoots in sand, under a bell-glass, in heat; sandy, fibry loam, and a little rough peat and leaf-mould. Winter temp., 55° to 65°; summer, 80° to 85°.
T. lœvis. White. June. Guiana. 1828.
 — *violæsa*. Yellow, red. Cayenne. 1820.
- Trigoni'dium.** (From *trigona*, a triangle, and *eidōs*, like; resemblance of

several parts of the plant. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*.)

Stove orchids, from Demerara, grown in pots. See ORCHIDS.

- T. acuminatum*. 1. Straw-coloured. 1834.
— *acutum*. Chocolate.
— *Egertonianum*. 1½. Pale brown. Year.
— *monophyllum*. See *Lælia monophylla*.
— *obtusum*. 1. Orange, brown. June. 1834.
B. R. t. 1923.
— *ringens*. Yellow, green. Mexico. 1839.
Now known as MORMOLYCE LINEOLATA.
— *tenuis*. Brown, purple. May. 1836.

Tril'isia. (From *trilix*, triple; referring to the divisions of the pappus. Nat. ord., *Compositæ*; Tribe, *Eupatoriaceæ*.)

Hardy, perennial herbs. Light soil. Divisions in spring, or seeds in autumn.

- T. odoratissima*. 4. Bright purple. September. North America. 1786. Syn., *Liatrix odoratissima*, Andr. Rep. t. 633. The bristled leaves have the odour of vanilla, hence the name, Vanilla Plant.
— *paniculata*. 3. Purple. August. Carolina. 1824. Syn., *Liatrix paniculata*.

Tril'lium. (From *trilix*, triple; the parts of the flower in threes. Nat. ord., *Liliacææ*; Tribe, *Medeolææ*. Allied to Paris.)

Hardy, North American, tuberous-rooted perennials. Division of the tuberous roots, and by seeds; sandy peat-border, or kept as alpine plants.

- T. Catesbæi*. ½. Red. May. 1820.
— *cerneum*. 1½. White. April. 1758. B. M. t. 954.

— *album*. ½. White. April. 1700. B. M. t. 1027.
— *ochroleucum*. Yellowish-white. Syn., *T. erectum*, var. *viridiflorum*. B. M. t. 3250.
— *erythrocarpum*. ½. Red, white. May. 1811. B. M. t. 3002. See also *T. grandiflorum*.
— *fœtidum*. See *T. erectum*.
— *grandiflorum*. ½. White. July. 1799. Syn., *T. erythrocarpum* of B. M. t. 855.
— *nerosum*. ½. Red. April. 1820.
— *nivalis*. ½. White. Summer. N. United States. 1879. B. M. t. 6449.
— *obovatum*. ½. Red. April. 1810.
— *petiolatum*. ½. Brown. April. 1811.
— *puberulum*. ½. Red. May. 1812.
— *sessile*. ½-1. Dark purple. March. 1759. B. M. t. 40.
— *californicum*. A robust variety. Gard. and For. 1890, p. 321, fig. 44.
— *stylisum*. ½. Red. April. 1823.
— *undulatum*. ½. Red. April. 1818.

Trime'zia. (From *treis*, three, and *merizo*, to divide; in allusion to the parts of the flower being in threes. Nat. ord., *Iridææ*; Tribe, *Moræææ*.)

Stove bulbous plant. For culture, see IRIS.

- T. l'urida*. 1. Yellow. April. West Indies. Syns., *T. martinicensis*, *Cipura martinicensis*, *Iris martinicensis*, B. M. t. 416, *Lansbergia caracasana*, and *L. martinicensis*.

Triole'na. (From *treis*, three, and

olene, the arm; in allusion to the three processes from the base of the anther. Nat. ord., *Melastomacææ*; Tribe, *Sone-rileææ*. Allied to *Monolena*.)

Stove perennial herb, with the habit of BERTOLONIA. Seeds; cuttings in sandy loam, in bottom heat and under a bell-glass. Rich sandy loam and leaf-mould; moist atmosphere. Summer temp., 65° to 80°; winter, 60° to 70°.
T. scorpioides. ½. Rose. Chiapas. 1859.

Trio'pterys. (From *treis*, three, and *pteron*, a wing; carpels, or divisions of seed-vessel, three-winged. Nat. ord., *Malpighiacææ*; Tribe, *Hiræææ*.)

Stove twiners. Cuttings of stubby side-shoots, any time in summer, in sand, under a bell-glass, and in a brisk, sweet moist bottom-heat; sandy loam and fibry peat. Winter temp., 48° to 58°; summer, 60° to 85°.

- T. jamaicensis*. 10. Yellow. Jamaica. 1822.
— *lucida*. Pink. May. Cuba. 1822.
— *sericea*. 6. Yellow. S. Amer. 1823.

Trio'steum. Feverwort. (From *treis*, three, and *osteon*, a bone; three bony seeds. Nat. ord., *Caprifoliacææ*; Tribe, *Lonicerææ*. Allied to the Honey-suckle.)

Hardy, North American, herbaceous perennials. Division of the plant in spring, or cuttings of the young shoots under a hand-light in the beginning of the summer; light, sandy soil and a little leaf-mould.

- T. angustifolium*. 1. Yellow. June. 1690.
— *perfoliatum*. 2. Dark red. June. 1730.
Swt. Fl. Gard. ser. 2, t. 45.

Tripha'sia. (From *triphasios*, triple; calyx three-toothed, and petals three. Nat. ord., *Rutacææ*; Tribe, *Aurantiacææ*.)

Greenhouse evergreen shrub. Cuttings of ripened shoots, at least those getting firm at the base, in sandy soil, in May, under a bell-glass, with a sweet bottom-heat; fibry, sandy loam and a little peat and dried cow-dung. Winter temp., 40° to 50°; summer, 60° to 80°.

- T. trifoliata*. 2. White. June. China. 1798.
Little Orange.

Triphysa'ria. (From *treis*, three, and *physa*, a bladder; the corolla has three bladder-like appendages. Nat. ord., *Scrophulariacææ*; Tribe, *Euphrasiacææ*.)

Hardy, annual herb.
T. versicolor. 1. Cream-colour to purple. June. North America. Now known as *Orthocarpus erianthus*, var. *roseus*.

Triplet Lily. *Tritele'ia*.

Tripoly. *A'ster Tripo'lium*.

Tri'psacum. (From *tripeo*, to thresh. Nat. ord., *Gramineææ*.)

Greenhouse, or hardy grass.
T. hermaphroditum. August. Central America. 1776. Syn., *Anthepora elegans*.

Triptery'gium. (From *treis*, three, and *pterygion*, a small wing; in reference to the three-winged fruit. Nat. ord., *Celastracææ*; Tribe, *Celastrææ*.)

Hardy subscandent shrub. We know nothing of its cultivation.

T. Wilfordi. White. Japan. 1867. Gfl. t. 612.

Triptilion. (From *treis*, three, and *vtilon*, a feather; the divisions of the pappus, or seed-crown. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

Hardy annuals, from Chili. Seeds in a slight holed in the beginning of April; plants pricked out, and either planted out in a sheltered place at the end of May, or bloomed in pots in a cool, airy greenhouse; rich, light soil.

T. cordifolium. $\frac{1}{2}$. White. July. 1824. B. R. t. 853.

— *spinosum*. $\frac{1}{2}$. Blue. July. 1827. Maund. Bot. t. 224.

Trista'gma. (From *treis*, three, and *stigma*, a drop; in allusion to the three honey glands. Nat. ord., *Liliaceæ*; Tribe, *Alliææ*. Syns., *Stemmatium* and *Stephanolirion*.)

Greenhouse, bulbous plant. Rich, sandy loam. Seeds or offsets.

T. narcissoides. $\frac{1}{2}$. White, orange. Chili. 1875. Syn., *Stemmatium narcissoides* and *Stephanolirion narcissoides*.

Trista'nia. (Named after *Tristan*, a French botanist. Nat. ord., *Myrtaceæ*.)

Hardy, yellow-flowered evergreens, from Australia. Cuttings of young, stubby side-shoots, or the points of shoots, two or three inches long, when getting a little firm at the base, in sand, under a glass, in April or May; sandy, fibry loam, and a little peat and charcoal. Winter temp., 35° to 45°.

T. arboreascens. 10. 1820.

— *conferta*. 6. August. 1805.

— *densiflora*. 1881.

— *depressa*. See *T. suaveolens*.

— *macrophylla*. 50. White. June. 1800. B. R. t. 1839.

— *nerifolia*. 6. July. 1804. B. C. t. 157. Syns., *Melaleuca nerifolia*, B. M. t. 1085, and *M. salicifolia*, Andr. Rep. t. 485.

— *suaveolens*. August. 1820. Syn., *T. depressa*.

Tritele'ja. (From *treis*, three, and *teleios*, complete; parts of the flower and fruit in threes. Nat. ord., *Liliaceæ*; Tribe, *Alliææ*.) United with **Brodiaæa** in the Genera *Plantarum*.

Very pretty little bulbs for a front border. Offset-bulbs; sandy loam, peat and leaf-mould; protected in a dry border from frost and damp in winter, or saved in a cold pit or frame.

T. aurea. 1. Yellow. April. Monte Video. 1838.

— *conspicua*. See *Milla conspicua*.

— *grandiflora*. See *Brodiaæa Douglasii*.

— *la'xa*. 14. Dark blue. July. California. 1832. B. R. t. 1685.

— *Leichtlinii*. See *Milla Leichtlinii*.

— *porrifolia*. See *Milla porrifolia*.

— *uniflora*. B. R. t. 1921. See *Milla uniflora*.

Trithri'nax. (From *treis*, three, and *thrinax*, a fan; alluding to the division and form of the leaves. Nat. ord., *Palmææ*; Tribe, *Coryphææ*.)

Stove-palms. For cultivation. see **THRINAX**.

T. acanthocoma. Rio Grande. 1878.

— *aculeata*. A synonym of *Acanthorhiza aculeata*.

— *brasiliensis*. 10. Brazil. 1875.

— *campestris*. South Argentine. 1889. Half-hardy.

— *mauritiæformis*. See *Sabal mauritiæformis*.

Tri'toma. (From *treis*, three, and *tenno*, to cut; three sharp edges of the ends of the leaves. Nat. ord., *Liliaceæ*; Tribe, *Hemerocallææ*.) This name is now superseded by **Kniphofia**.

Greenhouse, orange-flowered bulbs, from South Africa. Division, and by suckers from the roots; rich, sandy soil; as they bloom late, they are better for the protection of a cold pit in late autumn and winter.

T. Burche'lii. $\frac{1}{2}$. 1816. B. R. t. 1715.

— *Canari*. A yellow-flowered form of *Kniphofia aloides*.

— *flammea*. See *Blanfordia flammea*.

— *grandis*. Scarlet, yellow. 1884.

— *me'dia*. 2. April. 1789. Red. Lil. t. 161.

— *no'bilis*. 1882.

— *pu'mila*. 1. September. 1774. B. M. t. 764.

— *Roope'ri*. See *Kniphofia Rooperi*.

— *Savend'sii*. 1882.

— *Uva'ria*. B. M. t. 758. A synonym of *Kniphofia aloides*.

Tritoma'nthe Uva'ria is a synonym of **Kniphofia aloides**.

Trito'nia. (From *triton*, a weather-cock; variable direction of the stamens. Nat. ord., *Iridææ*; Tribe, *Ixiææ*.)

Montbretia is sometimes united with this genus. Allied to *Ixia*.)

Bulbs, from South Africa. For culture, see **IXIA**.

T. anigozanthæiflora. $\frac{2}{3}$. Yellow. June. 1825.

— *aurea*. 2. Orange. July. 1846. B. M. t. 4335. Now known as *Crocusma aurea*.

— *capensis*. 1. White or red. September. 1811. B. M. t. 618. Syn., *Gladiolus roseus*. Jacq. Ic. t. 261.

— *co'ncolor*. 1. Yellow. May. 1811.

Triumfetta. (In honour of G. B. Trionfetti, an Italian botanist, 1658-1708. Nat. ord., *Tiliaceæ*.)

Stove, or greenhouse herbs or subshrubs, of little horticultural value.

- T. annua*. Yellowish. August. East Indies. B. M. t. 2296.
 — *micropetala*. Yellow. East Indies. B. R. t. 1058.

Trixis. (From *trixos*, triple; triangular seed-vessel. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

White-flowered, blooming in August. *Senecioides* by seed in open ground in April; *auriculata*, by cuttings in sand, under a bell-glass, in May; sandy loam and leaf-mould, and the protection of a warm greenhouse in winter.

- T. auriculata*. 1. Brazil. 1827. Evergreen. B. M. t. 2765.
 — *senecioides*. 1½. Chili. 1821. Annual.

Trizeuxis. (From *treis*, three, and *zeuxis*, a union; the three outer perianth segments are united. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*.)

Stove, epiphytal orchid, to be grown on blocks of wood. Divisions.

- T. falca'ta*. ½-1. Green. Columbia and Trinidad. 1820. B. C. t. 975.

Troche'tia. (Named after Dutrochet, the celebrated French physiologist. Nat. ord., *Sterculiaceæ*; Tribe, *Dombeyææ*. Allied to *Dombeya*.)

Stove evergreen shrub. Cuttings of ripened shoots in sand, under a bell-glass, in March, and inserted in a sweet bottom-heat; sandpeat and fibry loam, with a little charcoal and broken freestone. Winter temp., 55° to 65°; summer, 65° to 88°.

- T. Blackburniana*. White, crimson. Mauritius. B. M. t. 7209.
 — *grandiflora*. 6. White, yellow. Mauritius. 1844. Syn., *Pentapetes Erythrozylon*. B. M. t. 1000.

Trochocarpa. (From *trochos*, a wheel, and *karpas*, a fruit. Nat. ord., *Epacridææ*; Tribe, *Stypheliææ*. Allied to *Styphelia*.)

Greenhouse evergreen tree. Cuttings of the points of young shoots, or stubby, short side-shoots getting firm at the base, in sand, under a bell-glass, and kept close in a frame or pit, any time in spring or summer; sandy, fibry peat.

Winter temp., 40° to 48°. More heat and moisture after flowering, and plenty of air and light before the end of autumn.

- T. lauri'na*. 25. Yellow. June. Australia. 1829. B. M. t. 3324.

Tro'lius. Globe-Flower. (From *trol*, the German for round; and the globular flowers. Nat. ord., *Ranunculaceæ*; Tribe, *Helleboreæ*. Allied to *Helleborus*.)

Hardy, yellow-flowered, herbaceous plants. Divisions of the plant in spring; light, loamy soil, rather moist.

- T. acau'lis*. ½. July. Cashmere. 1841. B. R. 1843, t. 32.

Tromsdo'rfia. (After J. B. Trommsdorf, an apothecary at Erfurt, 1770-1837. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandraceæ*.) A synonym of **Chirita**.

T. speciosa. A synonym of *Chirita Horsfieldii*.

Tropæolum. Indian Cress. (From *tropaion*, a trophy. Nat. ord., *Geraniaceæ*; Tribe, *Pelargoniceæ*.)

Annuals, by seed in the open ground in April; tuberous, by division of the roots, and by cuttings: the others by seeds; also by cuttings in sandy loam any time during spring and summer and early autumn; a rich, light soil suite them best. The best tuberous kinds multiply their tubers if the young shoots are laid in the ground as they commence growing. A tuber will generally form at the bends; none of them will stand frost, unless the hardy tuberous ones, and they had better be lifted and kept in dry sand until spring.

HARDY ANNUALS.

- T. digitatum*. Scarlet. July. Caraccas. 1852. Gf. t. 1146. Syn., *T. Gærtnerianum*.

Trotties. *Synophytum asperimum*.

Trowel. This implement, made of iron, from six to twelve inches long in the plate, and half as broad, hollowed like a scoop, and fixed on a short handle to hold with one hand, is convenient in removing small plants with a ball or lump of earth about their roots; lifting bulbous flower-roots after the flowering is past in summer, planting bulbs in patches or little clumps about the borders, for digging small patches, also, in the borders, and sowing hardy annual flower-seeds; likewise for filling mould into small pots, stirring the surface of the earth in pots, and fresh earthing them when necessary.

Troximon. (From *troximos*, edible; the plants, however, are not edible. Nat. ord., *Compositæ*.)

Perennial, almost stemless herbs. Sandy loam. Divisions.

T. glaucum. 1. Bright yellow. May. United States. 1811. B. M. t. 1667.

— *dasycephalum*. Bright yellow. May. North America. B. M. t. 3462. Syn., *Annogeton scorzoneraefolium*.

True Love. *Paris quadrifolia*.

Truffle. *Tuber magnatum*, Piedmontese Truffle; *T. Bo'rchiu*, Italy; *T. moschatum*, Musk Truffle, near Bath;

T. ciba'rium, Common Truffle, England. But, besides the tubers, there are other edible fungi known as truffles, viz., *Hydrob'olites Tula'snei*, Spye Park, Wilts; *Melagona'ster Broomeia' nus*, Red Truffle, near Bath.

These edible fungi have not yet been cultivated in England, though the Prussians have succeeded in making them a garden tenant, and Comte de Borch has been equally successful in Italy. The latter cultivates the Piedmont Truffle, and his process is this:—He either employs the soil where the truffle is found, or he prepares an artificial soil of seven parts good garden earth, two well-pulverized clayey soil, and one oak sawdust, intimately mixed. Decayed oak or beech leaves would be better, probably, than the sawdust. If the natural soil was used, he trenched it two feet deep, removing all the large stones, and adding oak-sawdust if necessary, and about one-tenth of powdered snail-shells if the soil was too stiff.

Choosing an aspect rather exposed to the north than the south, where no reflected rays could fall upon it, with every precaution to insure its being thoroughly soaked with pure rain-water, and after waiting a day or two, till it was in a proper state of moisture, he made rows half a foot deep, and in these, at six inches distance, he placed good and sound truffles, each of them being surrounded with two or three hand-fulls of oak sawdust, taking care to mark the rows accurately. Ridges were then made over each row, to prevent the truffles being injured by too abundant moisture. The bed was then left till the following autumn, with no other precaution than, in dry weather, to take care that it did not become too dry. The result, we are informed, was an abundant harvest every year from October to January.

Bradley, writing, in 1726, of the cultivation of the truffle in England, says, that the truffle may be easily cultivated where there are woods or coppices of oak or hazel, and where the soil is not too stiff, or inclining to chalk. The soil where they are most found is a reddish sandy loam; this will then be the best for our purpose, especially if it has lain long uncultivated. When we are thus provided with the proper soil, we must be sure to let it lie undisturbed till we are ready to plant, which will be in the months of October, November, and December, if the weather be open; for then the truffles are to be found in their full ripeness, and then, likewise, one may find them in a state of putrefaction, which

is the time when the spores are prepared for vegetation. It is in the last state that one ought to gather truffles for planting, or, at least, they should be in perfect ripeness. The proper soil and these rotten truffles being found, we may begin our work as follows: Open a spot of ground of a convenient space, and take out the earth about eight inches deep, and screen it, that it may be as fine as possible; then lay about two or three inches thick of this fine earth at the bottom of the trench or open ground, and upon it lay some of the over-ripe truffles, about a foot and a half distance from one another; and, as soon as possible, prepare a thin mud, made of the screened earth and water, well-stirred and mixed together, and pour it on the truffles till the open ground is quite filled up. By this means, in a few hours, the ground will be as closely settled about the truffles as if it had never been dug or disturbed at all, and you may expect a good crop in due time. You must, however, take care to choose your spots of ground in woods or coppices, or such places as are shaded with trees. Their favourite tree is the oak, or the quercus ilex or evergreen oak, as the elm is the favourite of the morille. Notwithstanding these statements, it is quite certain that, at present, the art of cultivating the truffle is not known in England; and it will remain unknown, probably, until we have discovered how its spawn can be prepared as for cultivating the mushroom.

Mr. Gower says he recommended an old truffle hunter to bury, at the proper depth, some of his truffles that were in a state of decay and unfit for the table under one of the unproductive trees sufficient in stature and in umbrageous development. At the beginning of next winter, when his visit was repeated, he sought for Mr. G., and told him, with great satisfaction, that the scheme had answered; for he had found two or three pounds of excellent truffles beneath the hitherto barren tree. By following this example, proprietors of trees adapted to truffles, and where the proper trees have been planted, may, in a short period, do that which a lapse of years, unassisted, would not effect. Of all trees the cedar of Lebanon is the most favourable to the growth of the truffle.

Trumpet Flower. *Bigno'nia*.

Trumpet Weed. *Eupato'rium purpu'reum*.

Truss is the florist's name for what botanists call an umbel of flowers, where

several flowers have their stalks united at one common centre, and thus spring from the root or branch on one stem, as in the auricula, polyanthus, and cowslip. See **Pip**.

Tryma'lium. (From *trymalia*, a perforation; the capsule has small holes at the top. Nat. ord., *Rhamnaceæ*; Tribe, *Rhamnaceæ*.)

Greenhouse evergreen shrubs, from Australia. For culture, see POMADERIS. *P. globulo'sa* and *P. Wendlandia'na* belong to this genus.

T. capsula'ris. 3. Purple, yellow. April. 1820.

— *odorat'issimum*. White. February. 1837.

— *spathula'ta*. 4. Purple, yellow. April. 1826.

Tsu'ga. (The Japanese name. Nat. ord., *Conifereæ*; Tribe, *Abietineæ*. Allied to *Picea* and *Abies*.)

Hardy trees. This has by some authors been considered as a section of *ABIES*.

T. Brunonia'na. 70. Bhotan. Syns., *Abies Brunoniana*, *A. dumosa*, and *Pinus Brunoniana*.

— *canade'nsis*. 70. North America. 1736. Syns., *Abies canadensis*, *Picea canadensis*, and *Pinus canadensis*. Hemlock Spruce.

— — *alba-epi'ca*. Tips of young branches white.

— *gra'cilis*. Branchlets very slender, drooping.

— — *microphy'lla*. Oregon. Syn., *Picea canadensis*, var. *microphy'lla*.

— — *milford'e'nsis*. A dwarf variety with drooping branches.

— — *na'na*. 3. More or less prostrate.

— *carolinia'na*. 60. North Carolina. 1836. G. C. 1836, xxvi. p. 781.

— *Hookeria'na*. British Columbia. 1852.

— *Mertensia'na*. 150. California. Syns., *Abies Albertiana*, *Abies heterophylla*, *A. Mertensiana*, *Pinus heterophylla* and *P. Mertensiana*.

— *Pattonia'na*. California. 1852. Syn., *Abies Williamsoni*.

— *Ro'e'ziii*. 60. North California.

— *Sieboldii*. 100. Japan. Syns., *Abies Tsuga*, *Picea Tsuga* and *Pinus Tsuga*.

— — *na'na*. 3. Japan. 1872. Syns., *Abies Tsuga*, var. *nana*, and *Pinus Tsuga*, var. *nana*.

Tube Flower. *Clerode'ndron Siphona'nthus*.

Tuber. A roundish, underground stem furnished with buds, which under favourable conditions develop into new plants, e.g., the Potato.

Tu'ber ciba'rium. See **Truffle**.

Tuberose. *Polia'nthes tubero'sa*.

Tulba'gia. (After a Dutch governor at the Cape of Good Hope, named *Tulbagh*. Nat. ord., *Liliaceæ*.)

Greenhouse herbs, with perennial rhizomes. Compost of sandy loam or peat. Offsets or seeds.

T. affi'nis. See *T. alliacea*, var. *affinis*.

— *alkia'cea*. 1-1½. Greenish-purple. June. South Africa. 1820. Ref. Bot. t. 349.

See also *T. capensis*.

— — *affinis*. A robust variety. Syn., *T. affinis*.

- T. alba*'cea *Ludwigia*'na. 1½-2. Syn., *T. Ludwigiana*.
 — *capensis*. 1½-2. Greenish-purple. June. South Africa. 1774. Jacq. Vind. t. 115. Syn., *T. alliacea* of B. M. t. 806.

 — *natalesis*. Greenish-white. Natal. 1891.
 — *viola*'cea. 1-2. Purplish-violet. March. South Africa. 1838. B. M. t. 8555.

Tulip. *Tu'lipa*.

Tu'lipa. The Tulip. (From its Persian name, *thoulyban*. Nat. ord., *Liliaceæ*; Tribe, *Tulipeæ*. Syn., *Orithya*.)

Hardy bulbs. Seeds for new varieties; offsets; a rich compost, made of loam, sand, and vegetable mould, suits them best; common kinds may remain for years in the same place if you top-dress them, and do not want to separate the bulbs.

- T. acuminata*'ta. Variable. May. 1810. Syn., *T. cornuta*. B. R. t. 127. Turkish Tulip. Native country unknown.

Tulip as a Florist's Flower.—Florists call tulips *seedlings* until they have bloomed; after this those preserved on account of their good form and habit, as well as the offsets they produce, are called *breeders*. After some years the petals of these become striped, and they are then said to be *broken*. If the striping is good they are said to have a *good strain*; if it be inferior, they are described as having a *bad strain*. A *rectified* tulip is synonymous with a tulip having a good strain.

A *feathered* tulip has a dark-coloured edge round its petals, gradually becoming lighter on the margin next the centre of the petal. The feathering is said to be *light*, if narrow; *heavy*, if broad; and *irregular*, if its inner edge has a broken outline.

A *flamed* tulip is one that has a dark-pointed spot, somewhat in shape like the flame of a candle, in the centre of each petal.

Sometimes a tulip is both *feathered* and *flamed*.

A *Bizard* tulip has a yellow ground, and coloured marks on its petals.

A *Byblamen* is white, marked with black, lilac, or purple.

A *Rose* is white, with marks of crimson, pink, or scarlet.

The end of September is a good time for preparing the tulip-bed.

Situation.—The aspect should be open to the south and south-east, but well sheltered from the north, north-east, and north-west winds. We prefer a perfectly level surface, because the advantage of rain falling upon the bed and sinking into the earth is more certain than on a slope. The elevation of the site is also a consideration worth serious attention. Wherever it is in the power of the cultivator of tulips intended for exhibition to choose the site, let him choose the happy medium, neither too high nor too low. If there are no shelters already on the spot to defend and protect those choice flowers from the untoward blasts of the northern quarter, there ought to be some prepared. A close wooden paling is the one most ready and effectual, and if made of deal or oak, and well-painted, will last several years. Beech, hornbeam, yew, or arbor vitæ hedges are very excellent; but they require several years' growth before they are high enough to screen the flowers effectually. They might be planted behind the paling, to be advancing in growth; so that when the paling decays the hedges would be high and thick enough to answer the purpose. Whatever shelter is made use of, it should be placed at a sufficient distance from the beds not to draw up the flowers, or prevent a full exposure to light. On these accounts, or for these reasons, the wind-shelters should never exceed six or eight feet high.

Draining.—The tulip loves a deep soil and a dry subsoil. Where there is a good depth of good loam, with a dry, gravelly, or sandy bottom, no more drains are required than one or two formed with drain-pipes and tiles to carry off the water that may fall in wet seasons on the surface. An upright shaft, with a grating on the top to catch this surface-water, will be necessary. When the natural soil is shallow and the subsoil clay, or any other water-retaining substance, set out the bed the desired length and breadth, and cast on one side all the good soil, shovelling the small crumbs; then dig, or hack or shovel out the subsoil till the bed is eighteen inches deep. After that is finished, dig a drain in the centre of the bed six inches deep, and wide enough to allow the operator to lay down first the flat tiles, and then the circular pipes, with holes in the latter to admit the water to escape into them, and then be carried clean away. When the pipes, etc., are laid down, cover them with rubble, and then lay all over the bottom

of the bed three or four inches of either small stones, broken clinkers, or brick-ends. Upon this drainage lay a stratum of short straw or small brushwood; make this smooth, and you may consider the drainage complete.

Manure and Soil.—Procure some one-year-old cow-dung; spread over and upon the drains a stratum of this cow-dung two inches thick; then mix about one-sixth of very well-decomposed hotbed dung with the loam thrown out and laid on one side on commencing the operation of draining. If there is not enough soil to make the bed up level as before, procure some good loam for the purpose, mixing it with the same proportion of well-decomposed dung. If the situation is low and damp, it will be advisable to place an edging round the bed six or eight inches deep, of sufficient strength to bear up the soil when it is raised to that height. The best material for an edging of this kind is blue slate, which may now be had very reasonably; the next best are common flags of slate; and the next, slabs of wood nailed to strong uprights driven into the ground at proper intervals. Mix the top surface with a considerable mixture of river sand; this will cause the bulbs to come out of the soil at taking-up time clean and of a bright brown colour. Should the collection be large, there should be two parallel beds, with a walk between them.

Planting.—The best season is about the beginning of the second week in November, as near the tenth of that month as the weather and the state of the ground will permit. The rule applies to all the country north of London; perhaps, in the milder climate of the southern counties, a week later would be better. Too early planting is injurious, inasmuch as the leaves will be pushing through before the severe weather has passed away, and would then be in danger, however well protected, of being frost-nipped, and, consequently, injured not only for that year, but also for years to come.

The Method of Planting is governed by the height of the flower-stems; for, as some varieties grow taller than others, the tallest should be in the centre of the bed. This consideration renders it necessary to plant them in rows lengthways of the bed, and not across it. This being determined upon, let the soil of the bed be levelled and made tolerably smooth; then, with a triangular hoe, draw a drill the length of the bed, as near two inches deep as possible. To accomplish this quite straight, it will be necessary to have a line stretched very tightly the whole

length of the bed, at such a distance from the centre as will allow the point of the hoe, in drawing the drill, to be exactly in the centre. As soon as the drill is drawn, bring out all the tall growers, and plant them five inches apart at the bottom, giving each a gentle pressure. When the row is finished, thrust in at each end a strong stick; this is to mark where the row of bulbs is when covered up. Of very choice and expensive varieties, some florists recommend covering the bulbs with fine white sand; but, if the soil is mixed with sand, we think the white sand may be dispensed with. Cover them up by drawing the soil over them with a short-toothed rake. After that let the soil on each side of the planted row be stirred up with a three-pronged fork. Then set the line at the right distance from the centre (we mentioned that the beds should be four feet wide, which would allow nine inches between each of the five rows, and six inches next the edging); the line then must be set at such a distance from the centre, that the next row of bulbs will be exactly nine inches apart from the centre one. Draw the drill the same depth as the first, and plant the next tallest flowers in it. Then mark the row with a stick at each end, and so proceed till the whole is finished; the lowest growers will then be next the paths all round the bed. Each variety must be numbered, and the numbers put in so securely that they cannot be easily displaced.

Shelter is necessary for the flower before and when in bloom. Where the collection is small, and the means small too, this consists merely of hoops, either of wood or iron, with canvas covers or mats to be thrown over the hoops, which should be high enough to keep the covering clear of the flowers. This covering should be applied not only when the plants are in bloom, but also to shelter them from the late frosts that sometimes come after the plants make their appearance, as well as from the cutting winds that often visit us in this country during the early months of the year. This shelter, however, must not be used except when absolutely necessary. Too much shelter only coddles the plants, and makes them so tender that a too sudden exposure, or the least neglect in applying the covering, would be equally as injurious as no shelter at all; therefore, on all favourable occasions, remove the coverings entirely, and let them have the benefit of fine weather and gentle rains.

Where the collection is large, and the

means ample, the most convenient width of each bed would be five feet; this will hold five rows nine inches apart. A walk between them may be either three or four feet; the latter will allow more room for the operator and the spectator. Three feet beyond each bed, on the outer sides, place a row of pillars, four and a half inches square, to support the shelter; each pillar may either be let into the ground and well rammed, or be inserted into an iron or stone socket. These pillars should stand above the surface at least five feet, and at a distance of five feet from each other. On the top of each pillar a rafter should be placed, to meet a corresponding rafter in the centre of the space just over the centre of the walk. Each rafter, at the junction, must be firmly fastened to a longitudinal piece of wood running the whole length of the beds, the length of the beds depending, of course, upon the number of roots, or size of the collection. There will then be required two rollers of wood of the length of the structure. On each of these nail a sheet of canvas of sufficient width to drop down on each side nearly to the ground. On the top, at the centre, fit a pair of weather-boards, projecting high enough to allow the roller and canvas to go under them, one on each side. This will preserve the canvas from rotting, and so enable it to be used for several years.

— *stricta*. Pink. Altaia. 1834.

Tupa. (The name of one of the species in Chili. Nat. ord., *Campanu-*

laceæ; Tribe, *Lobeliaceæ*.) A synonym of *Lobelia*.

Half-hardy herbaceous perennials. Cuttings, but chiefly by division of the suckers that spring up after the flowering stalks are cut down; rich, sandy loam. When planted out in a bed the surface may be dressed with advantage with rotten dung. Unless in a very sheltered place, they require the protection of a cold pit or a greenhouse in winter; and to flourish well they should be divided and potted, and assisted with a little heat in a bed before planting out in May.

Turf may be obtained either by sowing grass seeds, or laying turf obtained from a common or down: if the latter mode can be adopted it is the best, as the turf is obtained at once, and is more regular than can be obtained under the best circumstances from seed. All the preparation of the soil required is to dig it level a spade deep, provided the subsoil is open, otherwise to have a good drainage effected (see **Draining**); to have all large stones removed from the surface, and to have it brought to a perfect level by repeated rollings, and filling up the hollows when necessary, as indicated by the level. The surface being then loosened by raking is ready for the seed or turf.

By Seed.—See **Grass**.

By Turf.—The season for laying turf is any time from September till April or May, though it will grow at almost any time of the year, even if there be occasion to lay it in summer, and dry weather

succeed ; for although it will open at the joints, and turn brown, as if dead, yet after the first rain it will close again, and resume its verdure. The turf for this use is cut with an iron instrument called a turving iron, observing to cut the pieces all an equal width, length, and thickness—the proper size is a foot wide, a yard long, and about an inch thick ; they should be first marked by line the proper width, length, and depth, with a *racer* or *rutter* ; racing them first longwise a foot wide, then across in yard lengths ; then proceed to cut them up, having particular regard to cut them level, and equal in thickness, otherwise it will be impossible to lay them level. As you cut, a man or boy should roll each turf up close and tight, the grassside inwards, and pile them up by tens, especially if they are cut by the hundred. If they are cut by the hundred, the price is from sixpence to a shilling, according to the nature of the soil, whether soft and easy to cut, or hard, or stony. A man will cut from three to five, six, or seven hundred in a day, or more, if very soft, easy-cutting turf, and having a person to race them out and roll them up, turf and turf, as they are cut. They are to be laid regularly, turf and turf, unrolling them as you lay them, joining them up quite close, edge to edge, making good all deficiency of broken parts as you go on ; and, as soon as laid, it should be well beaten with broad, heavy, wooden beaters, made of flat pieces of elm or oak plank, two inches thick, fifteen or eighteen inches long, and a foot broad, having a long handle fixed slanting in the middle of the upper side ; and with these beat the grass regularly all over, and then roll it well with a heavy roller, observing that the beating and rolling should be repeated in moist weather. If very dry, hot weather succeeds, so as to occasion the turf to shrink and open at the joints, a good watering will be of much advantage.

By Inoculation.—If turf is scarce, cut turfs into pieces, about three inches square, and plant these, green side up, pretty thickly over the space intended for the lawn. Beat them down into the soil, and water freely ; roll frequently, and water also in dry weather. The turf will soon be as close, and the sward as perfect, as if the ground had been entirely turfed.

Turf Ashes. See Ashes.

These, which are the basis of charred turf, now becoming so usual a manure, are, according to M. Sprengel, thus constituted :

Silica	93.10
Alumina	1.35
Oxide of iron	1.73
— manganese	0.32
Lime	0.62
Magnesia	0.33
Potash, combined with sulphuric acid	0.38
Common salt	0.08
Sulphuric acid, combined with potash and lime	1.70
Phosphoric acid, combined with lime and magnesia	0.39

Turf Tools are the *Racer* or *Rutter*, for cutting the edges of turf after it has been laid, and for cutting the outlines of the turfs when first obtained. It is a thin, sharp-edged implement, somewhat resembling a cheese-cutter, fixed to a handle about four feet long.

The *Turfing Iron* is for raising or peeling off the turfs from the soil. It

has an arrow-headed, flat blade, with an angular handle.

A *Turf or Daisy Rake* consists of a piece of thin plate iron cut into teeth, with two slips of ash, or other tough wood, between which it is firmly riveted to form a back, and keep it from bending. When put together, the back is an inch and a quarter thick. The wood is bevelled half an inch above the interstices of the teeth, at which point the iron is slightly bent longitudinally, to admit the thickness of wood underneath, and give a proper inclination to the handle. The

instrument serves both as a grass rake and a daisy rake, and has the advantage over the daisy rakes in common use of being easier cleaned, on account of the wideness of the interstices between the teeth.

The *Turf-Beater* or *Beetle* is made of a stout flat piece of wood about a foot square, furnished with a long handle fixed to it at such an angle as to allow of its being brought down flat upon the turf. Its object is to level newly laid turf, and press it firmly into position.

Turgo'sia. (From *turgesco*, to become turgid; the plants are succulent. Nat. ord., *Crassulaceæ*.) A synonym of **Crassula**.

Turnips. *Bra'ssica ra'pa.*

Varieties.—For the first sowings:—Early White Dutch, Early Stone, Early Munich and Extra Early Milan.

For the spring sowings:—Common Round White, Large Round White, Large Green-topped, Large Red-topped, Yellow Dutch, Tankard, French, Small Round French, Swedish, Moscow, or Narva.

Sowing may commence at the end of February, a small portion on a warm border, and some in a moderate hotbed of the first two varieties mentioned. These will be fit for use during April. The sowing on a border to be repeated in the beginning of March, and these will produce throughout May.

These sowings are to be repeated in small proportions, at monthly intervals, until the beginning of July, when the main crop for the supply of the winter may be inserted; and finally, small crops at the commencement of August and September for Spring.

Mode.—Sow broadcast, or in drills twelve inches apart, and very thin; and to enable the seed to be distributed regularly, mix it well with sand before

sowing. Each sowing should, if possible, be performed in showery weather; if otherwise, water at the time of insertion, and three times a week afterwards.

Thin the plants when they have four or five leaves about two inches in breadth to at least twelve inches asunder from each other.

Water must be given frequently and plentifully, as on a regular supply of moisture their goodness, in a great measure, depends.

In November or December, before the setting-in of frost, some of the bulbs must be taken up, and the tops and roots being removed, preserved under shelter in sand. The young tops are much in request during spring; they must be gathered when very young, otherwise they are strong-flavoured and bitterish.

To obtain Seed, some of the most perfect roots of those which will withstand the winter may remain where grown; or they may be transplanted in November or February; of the two earliest varieties, sown on a border early in March, some of the bulbs being allowed to remain will produce seed the same autumn.

Manures.—The best manure for turnips is stable-dung; and next in their order, guano, super-phosphate of lime, soot, and salt.

For the injuries to which the turnip is liable, see **Athalia**, **Cabbage** **Ambury**, and **Black Fly**.

Turnip Cabbage (*Bra'ssica na'po-bra'ssica*), and Turnip-rooted Cabbage (*B. caul'ro-ra'pa*). See **Knohl-Kohl**.

— *exilis*. 10. Pale purple. July. Sylhet. 1823.

— *grandiflora*. 10. July. N. S. Wales. 1822.

Typha. Bullrush; Reed Mace. (A name used by Theophrastus. Nat. ord., *Typhaceæ*.)

Hardy, perennial herbs, thriving by the sides of shallow rivers or ponds. Seeds or divisions.

T. angustifolia. Brown. July. Britain. Eng. Bot. ed. 3, t. 1386.

— *latifolia*. 3-7. Brown. July. Britain. Eng. Bot. ed. 3, t. 1385.

Typhonium. (A name applied to some Aroid by the ancients. Nat. ord., *Aroideæ*; Tribe, *Arineæ*. Allied to *Arum*.)

Stove tuberous-rooted herbs. Offsets. Rich loam and leaf-mould. Give plenty of water when flowering. Summer temp., 60° to 80°; winter, 58° to 65°.

- T. Brownii*. ½. Spathe and spadix dark lurid purple. April. Australia. 1875.
 — *cuspidatum*. 1. Spathe green; spadix whitish. East Indies. 1819. Syn., *Arum flagelliforme*. B. C. t. 396.
 — *divaricatum*. 2. Purple. July. East Indies. 1759. Syn., *T. trilobatum* of Curtis, *Arum divaricatum*, *Arum trilobatum*, B. M. t. 339, and *Arum trilobatum*, var. *auriculatum*, B. M. t. 2324.
 — *Huegelianum*. Spathe purple-brown; spadix blackish. Himalaya. 1879. Syn., *Heterostatis Huegeliana*.
 — *trilobatum*. 1½. Green, rose-purple. East Indies. 1714. Syn., *Arum orizense*, B. R. t. 450. See also *T. divaricatum*.

Tyto'nia. The Water Balsam. (In honour of *A. Tyton*, a patron of botany. Nat. ord., *Geraniaceæ*; Tribe, *Balsamineæ*.)

This genus is now called *Hydrocera*. Stove aquatic. Seeds sown in spring in a good hotbed, and grown in strong, loamy soil, with the pot immersed in water in a tub, and receiving the high temperature of a plant stove from 65° to 90°.

T. natans. Various. August. India. 1810.

U.

Ulcer. See **Canker.**

U'lex. Furze. (From the Celtic *ac*, point; the prickly branches. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*.)

Hardy, yellow-flowered evergreens. Seeds in spring; deep, light soil, though not very particular. The gorse, whin, or furze is valuable, not only for its great beauty, but as constituting a valuable fodder and fence-plant. The *Double-blossomed Furze* is very beautiful, and worthy of a place in small gardens, and is propagated by cuttings in spring and autumn, in a shady, sandy border, or under hand-glasses. The *Upright or Irish Furze* is propagated in a similar manner, and is also valuable for fodder; but it seldom flowers, and when it does has generally only a few flowers on a plant. See **HEDGE**.

- U. europæus*. 6. Spring and autumn. Britain. Eng. Bot. ed. 3, t. 323.
 — *ac-re-pleno*. 6. May. Britain.
 — *strictus*. Branches erect. Syns., *U. hibernicus* and *U. strictus*. Irish Furze.

 — *nanus*. 3. Autumn. North West Europe.
 — *Galli*. A variety with longer spines. Syn., *U. Galli*. Fl. Ser. t. 441b.
 — *parviflorus*. 4. July. South Europe. 1823. Syn., *U. provincialis*.
 — *provincialis*. See *U. parviflorus*.
 — *strictus*. See *U. europæus*, var. *strictus*.

Ull'o'a parasit'ica. A synonym of *Juanulloa aurantiaca*.

Ull'cus. (From *ulluco*, its Quito name. Nat. ord., *Chenopodiaceæ*; Tribe, *Ebaselleæ*. Syn., *Mellica*.)

Herbaceous tuberous-rooted plant. It is extensively grown in the mountains of Peru and Bolivia for the sake of its small potato-like tubers. It was tried in this country unsuccessfully as a substitute for the potato.

U. tuberosus. 2. Yellow. August. S. America. 1847. B. M. t. 4617. Syn., *Basella tuberosa*.

U'lmus. The Elm. (From the Celtic name *ulm*. Nat. ord., *Urticaceæ*; Tribe, *Ulmææ*.)

Nearly all hardy; all deciduous, and brown-flowered, blooming in April. *U. campestris* and its allies, by suckers and layers, and by grafting on *U. montana*. The latter is also propagated, not by suckers, but by layers, which root freely; but chiefly by seeds, which should be gathered in June as soon as ripe, and sown in light, mellow soil; or dried, and put in bags until the following March or April. Deep, dry, sandy loam suits all the species and varieties, and produces the most valuable timber.

— *maritima*. 1-3. White, greenish-purple. Autumn. Mediterranean region. 1829. Syns., *U. Scilla* and *Ornithogalum Squilla*. B. M. t. 918. The bulbs of this plant furnish the squills of commerce.

— *physoides*. ½. Whitish, purple. June. South Africa. 1804. Syn., *Albuca physodes*. B. M. t. 1046.

— *Scilla*. See *U. maritima*.

Urine. (See **Dung**.) The urine of all animals is excellent as manure; but it must be given only to plants whilst growing, and in a diluted state. One of the most fertilizing of liquid-manures is composed of cabbage-leaves, and other vegetable refuse, putrefied in the urine from a house or stable, and diluted with three times its quantity of water when applied. If mixed with bleaching powder (chloride of lime), there will be no offensive smell. Gypsum mixed with urine, or a little oil of vitriol poured into it, adds to its utility as a manure. Sulphate of iron, in the proportion of seven pounds to every hundred of urine, prevents the escape of ammonia during putrefaction.

Urope'dium. (From *oura*, a tail, and *podion*, a slipper; referring to the long form of the petals. Nat. ord., *Orchidæ*; Tribe, *Cypripediæ*.) See **Sele-nipedium**.

Stove orchids. See **ORCHIDS**.

U. Lindle'ni. See *Sclenipedium Lindeni*.

Urope'talon. (From *oura*, a tail, and *petalon*, a petal; the petals are lengthened out into tail-like appendages. Nat. ord., *Liliacæ*; Tribe, *Scilleæ*.) See **Dipcadi**.

Offsets in spring; sandy, light loam and leaf-mould. Must be kept dry in winter, either by protecting them in a border, or placing them in a cold pit; perhaps best by potting them, and keeping them in a pit or greenhouse, and dry, until growth has fairly commenced.

Urtica. Nettle. (From *uro*, to burn; most of the species are furnished with stinging hairs. Nat. ord., *Urticaceæ*; Tribe, *Urticeæ*.)

A genus of no horticultural value, best known by its British species—*dio'ica*, *pili'fera*, *urens*—which often occur as garden weeds.

U. æstivans. Jacq. H. Schoenb. t. 388. See *Fleurya æstivans*.

— *involuta* ta. B. M. t. 2481. A synonym of

Pilea involucreta.

— *reticulata*. B. M. t. 2567. A synonym of *Pilea reticulata*.

Urvillea. (After Captain Dumont D'Urville, a French naval officer and botanist. Nat. ord., *Sapindaceæ*.)

Climbing stove shrub.

U. ferrugi'nea. Whitish. South America.

Urosti'gma. See **Ficus**.

Ustilago. The typical genus of the *Ustilagineæ*, an order of microscopic fungi, commonly known as **Smuts**, which attack various flowering plants, more especially grasses. *Urocystis* is an allied genus.

Utricularia. Bladder-wort. (From *utriculus*, a little bottle; on account of the minute pitcher-like bodies developed on their roots and leaves. Nat. ord., *Lentibulariaceæ*. Allied to *Pinguicula*.)

A large genus of curious and very interesting plants, very few of which are in cultivation, although many are exceedingly pretty. We do not know that our native species are cultivated, but they are added here as they are quite worthy. The stove species should be grown in sphagnum-moss mixed with bits of charcoal, and treated like an orchid. The pitcher-like bodies are very curious: they are hollow, and have their inner surface covered with minute quadrifid hairs; the mouth is furnished with a little flap which acts like that of certain mouse-traps. Minute animalcules endeavour to get in these little pitchers, which are veritable traps; they push against the flap, which yields and allows them to enter, and then it springs back into its former position and closes the entrance, so that the animalcule cannot get out again, but, after a while, dies and decomposes, and the nutritive matter of its decomposed body is absorbed by the quadrifid hairs, and serves to nourish the plant.

V.

Vacc'inium. Whortleberry. (The derivation is doubtful, perhaps from *bacca*, a berry. Nat. ord., *Vacciniaceæ*; Tribe, *Euvaccinieæ*.)

Seeds in autumn; cuttings under a hand-light in summer; suckers; divisions; rooting stems from trailing along the ground; very sandy loam; if a portion of peat all the better. All hardy except *caracasa'num*, *leuco'stomum*, *meridona'le*, and *Rolliso'ni*, and all deciduous, and natives of North America, unless otherwise mentioned.

Vagaria. (Derivation not explained. Nat. ord., *Amarylloideæ*; Tribe, *Panocraticeæ*. Allied to *Eurycles*.)

- V. parviflora*. 1-2. Greenish-white. Autumn. Syria. 1815. Syn., *Paneratium parviflorum*. Red. Lil. t. 471.

Valdivia. (From the town of *Valdivia*, in Chili, near which it grows. Nat. ord., *Saxifragaceæ*; Tribe, *Escalonieæ*.)

Evergreen herbaceous perennial. Half-bardy. For cultivation, see TIARELLA.

- V. Gayana*. Rose. Chili. 1863.

Valeriana. Valerian. (Named after *Valerius*, who first used it in medicine. Nat. ord., *Valerianaceæ*.)

Hardy herbaceous perennials. Divisions of the root in spring, and seeds; common garden-soil; the tender sorts should have a dry place.

- V. alliariaefolia*. 1½. Red. June. Caucasus. 1826.
 — *angustifolia*. Sibth. Fl. Gr. t. 29. A synonym of *Centranthus angustifolius*.

 — *tripteris*. 1. White. May. Switzerland. 1762.
 — *tuberosa*. 1½. Light, red. June. South Europe. 1629.

Valeriane'lla. Lamb's Lettuce. (A diminutive of *Valerian*. Nat. ord., *Valerianaceæ*.)

Hardy annuals. Seeds in the open border, in spring. See CORN SALAD.

- V. congesta*. B. R. t. 1094. See *Plectritis congesta*.
 — *chinaica*. 1. Pink. July. South Europe. 1807.
 — *olitaria*. ½. Blue. April. Britain.

Valerian, Greek. *Polemonium ceruleum*.

Valerian, Long-spurred. *Centranthus macrocephalus*.

Valerian, Red. *Centranthus ruber*.

Valla'ris. (From *vallo*, to inclose; used for fences in Java. Nat. ord., *Apocynaceæ*; Tribe, *Echitideæ*.)

Stove evergreen twiner. Cuttings of short, firm, stubby side-shoots in sandy soil, under a glass, in heat, in May; sandy, fibry loam, and fibry peat. Winter temp., 55° to 60°; summer, 60° to 85°.

- V. pergularia*. 10. White. India. 1818. Ic. Pl. t. 153; Wight, Ic. t. 429.

Valle'sia. (Named after *F. Vallesio*, physician to Philip II. of Spain. Nat. ord., *Apocynaceæ*; Tribe, *Plumerieæ*.)

Stove, white-flowered evergreens. Cuttings of young shoots, getting firm, in sand, under a bell-glass in heat; sandy loam and fibry peat. Winter temp., 55° to 60°; summer, 60° to 85°.

- V. cymbæfolia*. 4. June. Mexico. 1821. Syn., *V. glabra*.
 — *dichotoma*. 8. May. Peru. 1822.
 — *glabra*. See *V. cymbæfolia*.

Vallisneria. (Named after *A. Vallisneri*, an Italian botanist. Nat. ord., *Hydrocharideæ*; Tribe, *Vallisnerieæ*.)

A floating, fresh-water perennial, whose flowers live under water, except just at the time of impregnation. Division; rich loam, in a good-sized pot, plunged deep in a tub or cistern of water. Winter temp., 45° to 50°; summer, 60° to 80°.

- V. spiralis*. White. July. South Europe. 1818.

Vallonea Oak. *Quercus Ægilops*.

Vallo'ta. (Named after *P. Vallot*, a French botanist. Nat. ord., *Amarylloideæ*; Tribe, *Amarylloceæ*. Allied to *Cyrtanthus*.)

A cross-seedling, by its pollen, was obtained by Mr. Beaton from *Cyrtanthus obliquus*, which no one could distinguish from a *Vallo'ta* of the same age. Greenhouse, scarlet-flowered bulbs, from the Cape of Good Hope. Offsets; sandy loam and peat, and leaf-mould. Winter temp., 40° to 45°, and dry; summer, 60° to 75°.

- V. purpurea*. 1½. May. 1774. Syn., *Amarylloideæ purpurea*. B. M. t. 1430. Scarborough Lily.

- V. purpurea eximia*. Red, white, crimson. Flor. Mag. t. 225.
 — *magnifica*. A brightly coloured variety.
 — *major*. May, 1774.
 — *minor*. 1. May, 1774.

Vallora'dia. A synonym of *Ceratostigma*.

Vancouve'ria. (From *Fort Vancouver*, California. Nat. ord., *Berberidæ*; Tribe, *Berberæ*.)

Hardy herbaceous perennial

- V. hexandra*. 3. Lilac. May. North Amer. 1827. Syn., *Epimedium hexandrum*.

Va'nda. (The Sanskrit name of the first-found species. Nat. ord., *Orchidæ*; Tribe, *Vandæ-Sarcantheæ*.)

Stove orchids, grown in baskets. See ORCHIDS.

- V. alpi'na*. Pale green, yellowish, dull purple. Knasya. 1837. Syn., *Luisia alpina*.
 — *Amesia'na*. Creamy white, suffused with rose. India. 1837. Warn. Orch. Alb. t. 296.
 — *Bateman'ni*. B. R. 1846, t. 59. See *Stauroopsis Batemanii*.
 — *Benc'ni*. Green, with crimson dots. Rangoon. 1886. B. M. t. 5611.
 — *bi'color*. Yellowish, lilac. India. 1875.
 — *Boza'lii Cobbia'na*. Milk-white, purple. G. C. 1881, xvi. p. 780.
 — *Cathcartii*. A synonym of *Arachnanthe Cathcartii*.
 — *cæru'lea*. 3. Pale blue; lip darker. Autumn. Khasya. 1849. Fl. Ser. t. 609.
 — *grandifl'ora*. A variety with large flowers. Rev. Hort. 1881, p. 290.

 — *testa'cea*. See *V. parviflora*.
 — *tri'color*. Yellow, crimson, purple. Java. Warn. Orch. Alb. t. 77. *V. tricolor* of B. M. t. 4432 is *V. suavis*, var. *flava*.

- V. tri-color cinnamo'nea*. Yellow, brown. Java. 1869.
 — *Dodgso'ni*. Light amber, reddish-brown, violet-purple, white.
 — *insignis*. Light yellow, with crimson spots; lip pale lilac. Spring and autumn.
 — *Patero'ni*. Creamy-white, with cinnamon-brown spots; lip bright magenta. G. C. 1884, xxii. p. 237.
 — *planilabris*. Citron-yellow, with brown spots; lip rose, mauve and chocolate-purple. Warn. Orch. Alb. t. 87.
 — *Russelia'na*. A brightly coloured variety.
 — *Warneri*. Edged with deep rose; lip deep rosy-purple. Warn. Sel. Orch. ser. 2, t. 39.
 — *undulata*. White, greenish, orange. India. 1875. Syn., *V. Goweræ*.
 — *violacea*. B. R. 1847, t. 30. See *Saccolabium violaceum*.
 — *Vipa'ni*. White, brownish-purple, yellow. Burmah. 1882.

Vandellia. (Named after *L. Vandelli*, a Portuguese botanist. Nat. ord., *Scrophulariaceæ*; Tribe, *Gratiolacæ*. Syns., *Hornemannia* and *Tittmannia*. Allied to *Torenia*.)

Tender annuals. Seeds in a hotbed, in spring; plants pricked off, and bloomed chiefly in the greenhouse, in light, rich soil.

- V. crustacea*. Blue. June. India. 1816. Wight Ic. t. 863. Syn., *Hornemannia ovata*.
 — *difu'sa*. 1. White. July. Santa Cruz. 1824.
 — *hirsuta*. Blue. June. India. 1823. Syn., *Hornemannia viscosa*.
 — *Rozburghii*. Purple. July. Coromandel. 1818.

Vangueria. (*Voa-vanguer*, the name of *V. edulis* in Madagascar. Nat. ord., *Rubiaceæ*; Tribe, *Vangueriææ*. Allied to *Plectronia*.)

V. edulis produces a good dessert fruit. Stove evergreen. Cuttings of half-ripened shoots in sand, under a bell-glass; sandy peat and fibry loam. Winter temp., 50° to 55°; summer, 60° to 85°.

- V. edulis*. 10. White. Madagascar. 1809.
 — *velutina*. 3. Pale yellowish-green. May. Madagascar. 1829. B. M. t. 3014.

Vanilla. (A diminutive of *vaina*, the Spanish for *oreath*; shape of seed-pod. Nat. ord., *Orchidacæ*; Tribe, *Neotiaceæ-Vanilleæ*. Syn., *Myrobroma*.)

Stove orchids, grown on blocks; white-flowered, where not otherwise specified. (See ORCHIDS.) The Vanilla of commerce is, or should be, the dried fruit of *V. planifolia*.

- V. acutifolia*. Caraccas. 1841.
 — *africa'na*. Sierra Leone. 1843.
 — *aromatica*. 10. July. South Europe. 1739.
 — *bicolor*. Dull red. Guiana.
 — *claviculata*. Cuba. 1838.
 — *Humboldtii*. Comoro Islands. 1885. G. C. 1885, xxiii. p. 726.
 — *lute'scens*. Yellow. La Guayra. 1859.
 — *Phaleno'psis*. Bluish-white, rosy, orange. Madagascar. 1869.
 — *planifolia*. 10. May. W. Ind. 1800. Andr. Rep. t. 538.
 — *Pompo'na*. Mexico.

Vapourer Moth. *Orgy'ia*.

Variogated Laurel. *Aucuba*.

Vasco'a. (After *Vasco de Gama*, who in 1497 travelled to the Cape of Good Hope, where this genus grows. Nat. ord., *Leguminosæ*; Tribe, *Genistecæ*.) See *Rafnia*.

V. amplexicaulis. See *Rafnia amplexicaulis*.
 — *perfoliata*. See *Rafnia perfoliata*.

Vasconella. See *Carica*.

Vegetable Manures. See *Green Manures*, *Ashes*, and *Manures*.

Vegetable Marrow. *Cucurbita ovifera*.

Veitchia. (In honour of *Mr. Veitch*, the well-known proprietor of the Chelsea nurseries. Nat. ord., *Coniferæ*.)

Hardy evergreen. See PINUS.
V. japonica. Japan. This is some monstrous state of *Picea Alcockiana*.

The following species bearing the name of VEITCHIA are PALMS:

- V. canterburyana*. See *Hedyscepe canterburyana*.
 — *Johannis*. Polynesia. 1868. Syn., *Kentia Johannis*.
 — *Storckii*. 40. Fiji. Syns., *Kentia elegans* and *K. Storckii*.

Ve'lia. Cress Rocket. (From *velar*, the Celtic name of cress. Nat. ord., *Cruciferæ*; Tribe, *Brassicæ*.)

Half-hardy evergreen. Cuttings of young shoots in sand, under a hand-light, in a shady place, in summer; a dry, airy, warm situation, such as in raised rock-work. North of London, in exposed, damp places, it will require a little protection in winter.

- V. pseu-do-cytisus*. 3. Yellow. April. Spain. 1759. B. R. t. 293.

Velle'ia. (Named after *Major Velley*, who studied sea-weeds. Nat. ord., *Goodenovicæ*. Syn., *Euthales*.)

Greenhouse, yellow-flowered evergreens, from Australia. Division; sandy loam and peat. Winter temp., 35° to 45°.

- V. lanceolata*. 1841. A synonym of *Goodenia filiformis*.
 — *lyrata*. †. April. 1819. B. R. t. 561.
 — *macrophylla*. 3-4. May. 1839. Syn., *Euthales macrophylla*, B. R. 1841, t. 3.
 — *paradoxa*. †. July. 1824. B. R. t. 971.
 — *spathulata*. †. April. 1825.
 — *trinervis*. 1. July. 1803. Syns., *Euthales trinervis* and *Goodenia tenella*, Andr. t. 466.

Vello'zia. (Named after a Spanish botanist. Nat. ord., *Liliacæ*; Tribe, *Velloziææ*. Allied to *Barbaccenia*.)

The Vellozias are perennials, from two to ten feet high, having trunks as large as a man's body, branching, and having tufts of leaves on the top like the *Yucca*. Greenhouse herbaceous. Division of the plant in spring; sandy loam and fibry peat. Winter temp., 40° to 50°; summer, 60° to 80°.

- V. ca'ndida*. White. Brazil. 1865. B. M. t. 5514.
 — *e'legans*. White, turning green. Natal or Madagascar. 1866. B. M. t. 5803. Syns., *V. Talboti* and *Talbotia elegans*.

- V. retine'ris*. 12. Blue. Natal. 1877. Syn., *Xerophyta retinervis*, Gf. t. 908.
 — *squamata*. Orange-red. Summer. Organ Mountains, Brazil. 1841. Syn., *Barbarentia squamata*, B. M. t. 4136.
 — *Talboti*. See *V. elegans*.

Veltheimia. (Named after *F. A. Veltheim*, a German botanist. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*. Allied to *Urginea*.)

Greenhouse bulbs, from South Africa, with flesh-coloured flowers. Offsets from the bulbs; rich, sandy loam. Winter temp., 35° to 45°.

- V. glauca*. 2. March. 1781. B. M. t. 1091.
 — *rubescens* *purpurea*. 1. Red, purple. July. 1854. B. M. t. 3456.
 — *intermedia*. 1½. April. 1800.
 — *speciosa* and *Uvaria* are synonyms of *Kniptophia Uvaria*.
 — *viridifolia*. 2. August. 1768. Syn., *Aletris capensis*, B. M. t. 501.

Vendium. (Derivation not stated, Nat. ord., *Compositæ*.)

V. calendulaeum is a half-hardy perennial. The others are hardy annuals. For culture, see *ARCOTIS*.

- V. calendulaeum*. 1-1. Ray yellow; disk nearly black. Summer. South Africa.
 — *fulgax*. 1½. Ray bright orange; disk blackish. South Africa. 1887. This is sometimes confused in gardens with *V. calendulaeum*.
 — *hirsutum*. 1. Ray bright orange; disk blackish. South Africa. 1887. Syn., *V. speciosum*.

Ventena'tia minor is a synonym of *Stylidium lineare*.

Ventila'go. (From *ventilo*, to be exposed to the wind. Nat. ord., *Rhamnææ*.)

Stove climbing shrub. For culture, see *BERCHEMIA*.

- V. madraspatana*. Green. June. India. 1822.

Ventilation. See *Greenhouse*.

Venus' Fly-trap. *Dionæa muscipula*.

Venus' Hair. *Adiantum capillus Venëris*.

Venus' Looking-glass. *Specularia speculum*.

Venus' Navelwort. *Omphalodes*.

Venus' Sumach. *Rhus cotinusa*.

Ve'pris. (From *vepres*, a thorn-bush. Nat. ord., *Rutacææ*.) See *Toddalia*.
V. lanceolata. See *Toddalia lanceolata*.

Vera'trum. (From *vere*, truly, and *ater*, black; colour of the roots. Nat. ord., *Liliacææ*; Tribe, *Veratracææ*.)

The plants in this genus are all poisons. Hardy herbaceous perennials. Seeds and divisions in spring; deep, rich loam.

- V. album*. 5. White. July. Europe. 1548. Red. Lil. t. 447.

- V. album Lobelia'num*. White. June. South Europe. 1818. Syn., *V. Lobelianum*.
 — *viride*. 5. Green. July. North America. 1742. Syn., *V. viride* and *Helonias viridis*, B. M. t. 1096.
 — *angustifolium*. A synonym of *Stenanthium angustifolium*.
 — *frigidum*. A synonym of *Stenanthium frigidum*.
 — *Lobelia'num*. See *V. album*, var. *Lobelianum*.
 — *Maackii*. 2. Dark purple. Summer. Eastern Siberia. 1888. Gf. t. 1070.
 — *nigrum*. 3. Dark purple. June. Siberia. 1596. B. M. t. 963.
 — *parviflorum*. 2. Green. June. Carolina. 1809. Syn., *Melanthium bracteolare*.
 — *Sabadilla*. A synonym of *Xerophyllum Sabadilla*.
 — *viride*. See *V. album*, var. *viride*.

Verba'scurn. Mullein. (From *barbascum*, bearded; the bearded stamens. Nat. ord., *Scrophulariacææ*; Tribe, *Verbascææ*.)

All yellow-flowered where not otherwise mentioned. All freely by seeds; perennials also by division of the roots in spring.

Verbe'na. Vervain. (From the Celtic *Ferfain*. Nat. ord., *Verbenaceae*.)

Annuals and biennials, by seed in a slight hot-bed in March, or in the open air in April; perennials, by division, layers, and cuttings; tender kinds, chiefly by cuttings, unless when seed is employed to obtain new varieties. These varieties are struck generally in spring and autumn for blooming in pots, but chiefly for decorating the flower-garden beds. A rich, sandy loam suits them best. The points of the shoots in spring strike best in a little peat. In autumn they can scarcely be kept too cool. The smallest piece will form a better plant than a larger piece.

GREENHOUSE HERBACEOUS.

Vere'ia. (Derivation doubtful. Nat. ord., *Crassulaceæ*.) See **Kalanchoe**, where it has been erroneously spelt **Vareia**.

- V. acutiflora*. Andr. Rep. t. 560. See *Kalanchoe acutiflora*.
 — *crenata*. Andr. Rep. t. 21. See *Kalanchoe crenata*.

Verge-cutter. A tool with a semi-circular blade fixed on a long handle for cutting the edges of turf around flower-beds, or walks.

Vernal Grass, Sweet-scented.
Anthoxanthum odoratum.

Vernonia. (Named after W. Ver-
non, a botanical traveller. Nat. ord.,
Compositæ; Tribe, *Vernoniaceæ*.)

All purple-flowered where not otherwise men-
tioned. Hardy, by seeds and divisions; tender,
by seeds, divisions, and cuttings under a hand-
light; rich, sandy loam; stove treatment.

GREENHOUSE SHRUB.

- V. galegifolia*. Andr. Rep. t. 319. A synonym of *Suaresonia galegifolia*.

Vicia Fa'ba, or Broad Bean. There are many varieties of this vegetable; but we shall only name those which are clearly distinct and valuable.

Early Mazagan.—This is from two to four feet high, and has seeds rather larger than horse-beans. Sow in spring, and the beans will be fit for table in about ten weeks. There are many varieties.

Long-Pod.—Sandwich, or Lisbon, has various names attached to these. Seeds whitish, about an inch long, and half that in width, flat. Very productive; good for maiu summer-crops. Sown in spring, about twelve weeks elapse before the beans are fit for table. Three to five feet high.

Johnson's Wonderful.—This is a long-pod, but even more productive; and we consider it the best of all the varieties. Pods very numerous; many with six or even eight beans in them, and bearing a succession of pods; seeds rather more broad in proportion to length.

Dutch Long-Pod has seeds still broader in proportion to length.

Green Long-Pod.—Nonpareil, or Genoa, differs chiefly from other long-pods by its seeds being green.

Toker has white, broad, oval seeds. Height, five feet. Sown in spring, its

beans are ready in twelve weeks ; rather coarse-flavoured.

Windsor.—Seeds whitish, flat, circular, an inch in diameter; only two or three in a pod. Produces a succession of pods. Four feet high. Many other names prefixed.

Green Windsor differs chiefly from the preceding in the colour of its seed.

The Red-Seeded, White-Blossomed, Red-Blossomed, and some others, have no merits equal to the preceding. The *Fan*, not being more than one foot high, is useful, in small gardens, to grow among other crops; but it is not productive, and its beans come all at once.

Other sorts are:—*Monarch Long-Pod*, *Marshall's Early Prolific*, *Taylor's Windsor Leviathan*, *Seville Giant Long-Pod*, *Beck's Dwarf Green Gem*, *Green Long-Pod*, *Mammoth Long-Pod*. These are all distinct and first-class varieties.

Soil and Situation.—The soil should vary with the season. For the winter-planting and early crops, a moderately rich and dry soil is best adapted to them, since, if too moist, the seed is apt to decay; whilst a cool-bottomed, more tenacious soil is best for the spring and summer sowings. The situation cannot be too unshaded; but a protection from violent winds is very beneficial.

Times and Modes of Sowing.—For the first production, in the following year, a large sowing of Long-pods may be made during the middle of November; and sowings may be continued to be made, from the beginning of January to the end of June, once every two or three weeks. Not later than the 1st of July a last sowing may be made. The *Early Mazagan* is best for the earliest and latest plantings, to produce the same year. When two to three inches high ridges should be drawn up on either side of the rows, which will facilitate covering during frosty weather. Bracken or other light litter will answer for a covering.

Sowing for Transplantation.—If the season has been lost for sowing at proper time, in the natural soil, for the early crops, or ground could not be spared or made ready, then sow for transplanting, either in small pots, turf-sods, or gentle hotbed, and of such extent as can be covered with a frame. If frames and hand-glasses are deficient, matting or litter, kept from injuring the plants by means of hooping, etc., is sometimes employed. Care must be taken that the beans are not weakened by a deficiency of air and light; to guard against it the lights should be taken entirely off every

day that excessive wet or cold does not forbid their removal. The usual time for removing them into the open ground, in a south border, is February, in mild and open weather.

Sowing to remain.—When sown to remain, the seed may be inserted in double rows, in drills, drawn by the hoe, from two and a half to three feet apart, from double row to double row, the double rows four inches apart, and two deep. Previous to sowing, in summer, if dry weather, the seed should be soaked for two or three hours in water; or, if sown in drills, these should be well watered immediately before the insertion.

When advanced to a height of three to four inches, earth up as recommended for the early crops. This should be often repeated. As soon as the various crops come into full blossom, two or three inches length of each stem is broken off. This, by preventing its increase in height, causes more sap to be afforded to the blossom, consequently causing it to advance with more rapidity, and to set more abundantly.

For Seed.—None of the pods ought to be gathered for the table from those plants intended for seed, the after-production never being so fine, and the plants raised from them are always deficient in vigour. They are fit for harvesting when the leaves have become blackish, which occurs at the end of August, or early in September. The pods may be gathered from the stems when ripe enough, and spread out thin, upon a dry, airy, boarded floor, to dry. Those only should be preserved that are fine and perfect. They are best stored in the pods until required. Seed-beans will sometimes vegetate after being kept for eight or ten years, but are seldom good for anything when more than two years old.

Insects.—See *Aphis fabæ*.

Victoria. (Named after Her Majesty *Queen Victoria*. Nat. ord., *Nymphaeaceæ*; Tribe, *Nymphaeæ*. Alliance near *Euryale* and *Nymphaea*.)

Stove herbaceous aquatic. Generally by seeds, sown in strong peat, and planted out in a reservoir of heated water as soon as germinated. From the size of the leaves, the tank must be twenty-five feet in diameter; and if the water is moved, or is being constantly furnished with a fresh supply, the plants will thrive all the better.

V. regia. Rosy-white. Autumn. River Amazon. 1836. B. M. tt. 4275-8. A description of this plant, accompanied by magnificent plates, was published by Sir William Hooker.

Victorian Hazel. *Pomaderris apetalæ*.

Vieusesu'xia. (Named after *M. Vieusesseux*, a Swiss botanist. Nat. ord., *Iridææ*; Tribe, *Moræææ*.) See *Moræa*.

Bulbs, from South Africa, requiring the same treatment as *IXIAS*.

Vigna. (Named after *D. Vigni*, a commentator on Theophrastus. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Dolichos*.)

Hardy, or half-hardy, yellow-flowered, climbing annuals. Seeds in a slight nothed in March, and afterwards planted out in the beginning of May, or sown in the end of April in sandy, light soil.

- V. Burchellii.* Purple. Summer. South Africa. 1816. Syn., *Otoptera Burchellii*. Greenhouse.
 — *Ca'tjang.* Yellow or red. July. East Indies. 1776. Syns., *Dolichos sesquipedatis*, *D. sinensis*, B. M. t. 2232, *D. tranquebaricus* and *D. unguiculatus*.
 — *glabra.* Yellow. July. Southern United States. 1685. Syn., *Dolichos luteolus*. Jacq. Vind. t. 90.

Viguie'ra. (Named after *L. G. A. Viguier*, a French botanist. Nat. ord., *Compositæ*; Tribe, *Helianthoidææ*. Allied to the Sunflower.)

Stove, yellow-flowered, herbaceous perennials. Divisions in spring, and cuttings of young shoots as fresh growth commences, in sandy soil, in a hotbed, in March; sandy peat and fibry loam. Winter temp., 50° to 55°; summer, 60° to 75°.

- V. dentata.* 3. July. Mexico. 1826.
 — *helianthoi'des.* 3. July. Cuba. 1825.
 — *linearis.* 2. Yellow. September. Mexico. 1823. Syn., *Helianthus linearis*. B. B. t. 523. Half-hardy.
 — *prostrata.* July. N. Amer. 1800. Hardy.
 — *rigida.* G. C. 1881, xvi. p. 396. See *Helianthus rigidus*.

Villami'llia. (Derivation uncertain. Nat. ord., *Phytolaccææ*; Tribe, *Riviniææ*.)

Stove evergreen. For culture, see *RIVINA*.
V. octandra. 2. White. May. West Indies. 1752. Syn., *Rivina octandra*.

Villano'va. (After *T. M. Villanova*, 1757-1802, Professor of Botany at Valencia. Nat. ord., *Compositæ*; Tribe, *Helenioidææ*. Allied to *Palafoxia*.)

Hardy annual. Seeds in the open border in April.

- V. chrysanthemoi'des.* 1 to 2. Yellow. Colorado. September. 1878.

Villare'sia. (In honour of *M. Villarez*, a Spaniard. Nat. ord., *Olacinææ*; Tribe, *Icacinææ*.)

Stove shrub. For cultivation, see *MONETIA*.
V. mucronata. White. September. Chili.

Villa'rsia. (Named after *Villars*, a French botanist. Nat. ord., *Gentianeææ*; Tribe, *Menyantheææ*.)

Yellow-flowered, where not otherwise stated. Divisions and seeds in spring. Most of them must be treated as aquatics, either planted in pans or tubs, or potted and set in large saucers, and coaxed with stove or greenhouse treatment. The hardest like the protection of the latter, though they may stand frequently in the open air.

HERBACEOUS PERENNIALS.

Vilmori'nia. (Named after *M. Vilmorin*, a celebrated French nurseryman. Nat. ord., *Leguminosææ*; Tribe, *Galegeææ*.)

Stove evergreen. Seeds, soaked in warm water, and sown in a hotbed in spring; also cuttings of half-ripened shoots in sand, under a bell-glass, in April, and in bottom-heat; sandy peat and fibry loam. Winter temp., 55° to 60°; summer, 60° to 85°.

- V. multiflora.* 6. Purple. Domingo. 1826. Syn., *Citioria multiflora*.

Vimina'ria. Rush Broom. (From *vimen*, a twig; the twiggy, leafless branches. Nat. ord., *Leguminosææ*; Tribe, *Podalyriææ*. Allied to *Daviesia*.)

Greenhouse, yellow-flowered evergreens, from Australia. Cuttings of half-ripened shoots in sand, under a bell-glass, in April; also by seeds in a gentle hotbed; loam and peat. Winter temp., 40° to 45°.

- V. denudata.* 3. August. 1780. B. M. t. 1190.

Violet Forcing.—To obtain *Neapolitan Violets* in winter, select a warm, sheltered corner; cast out trenches a foot deep and five feet wide into the alleys, and make a turf wall all round to the desired height, for holding about fifteen or eighteen inches of leaves, rubbish-heap refuse, or any fermenting materials likely to afford a little bottom-heat, upon which place about eight or nine inches of rich, open soil. The width regulate by any lights to be spared for a time, or thatched hurdles, or other protectors. Take the plants, up from the store plantation carefully, with balls of earth to their roots, and plant from ten to twelve inches apart each way, first clearing them of any side-shoots or suckers; afterwards keep clear of dead leaves, etc., well surface-stir, and never allow to get dry. No lights or protection are to be placed over them until frosty nights set in, or very heavy rains; then, at all times, tilt on both sides, with abundance of air, if the weather is not too severe. By such treatment the foliage is always large, thick, and of a beautiful dark green, the flowers abundant and large. No side-runners are to be allowed to run until April, at which time they are to be encouraged to grow; and open, sandy, rich soil sifted amongst them, and kept well watered, to encourage them to root freely. A partially-shaded piece of good ground is then to be chosen in the month of May, and the Violets then forked up, old and young altogether, and the best of the young plants selected and planted out a foot apart each way singly. They are to be kept well surface-stirred all the summer, and by October they will be fine plants to take up as above described.

Russian Violets—*Single White*, *Double White*, *Double Blue*, and other hardy varieties—grow in a similar way, with regard to planting out the young runners and summer treatment, and they are also to be carefully taken up in October; some placed in turf-pits, with gentle bottom-heat, and some without bottom-heat, and a quantity planted on sloping banks. By this simple contrivance

abundance of luxuriant flowers are kept in succession from September till May. Every variety is kept clear from side-shoots or runners all the summer. All the varieties are particularly fond of charred articles mixed with the soil.

Violet, Foreign. *Schweigge'ra.*

Violet, Fringed. *Thysano'tus.*

Violet Fungi. *Æci'dium depau'perans* and *Æ. Vi'olæ.* Violets are often attacked by a Fungus which appears in yellow patches on their leaves. This is the *Æ. Vi'olæ*, and if these patches are magnified they will be found to be composed of minute cups (cluster-cups) filled with spores. *Æ. depau'perans* is much less common, and differs in having the cluster-cups solitary, and not collected in patches as in *Æ. Vi'olæ*. Both species greatly injure the Violet plants, by destroying their leaves and dwarfing their growth. The Fungus should be destroyed by burning the infected plants on its first appearance, to prevent its spreading.

— *umbrosa*. 30. Jamaica. 1823.

Vítis. The Vine. (From the Celtic *swyd*, pronounced *vid*, best of trees. Nat. ord., *Ampelideæ*.)

Greenhouse or hardy deciduous climbers, all but one green-flowered. Few are worth growing except *vinifera* and its varieties; the other species are viewed chiefly in this country as botanical curiosities. All are propagated by cuttings and buds of the ripe wood, layers, and by grafting and inarching. Soil for all, a rich, open loam. See GRAPE VINE.

Many of the species enumerated below are cultivated under the names of CISSUS and AMPELOPSIS, which are synonyms of VITIS.

V. acuminata. Eastern Asia. 1890.

— *æstivalis*. 20. May. North America. 1656. American Summer Grape.

— *albo-nitens*. Brazil. 1871. Syn., *Cissus albinitens*. Stove.

— *amure'nsis*. Leaves woolly on both sides when young. Gfl. t. 339.

- V. vinifera* *apiifolia*. 20. June. 1648. Syn., *V. laciniosa*.
 — *vitigifera*. Green. E. Indies. 1772.
 — *vulpina*. May. North America. Jacq. H. Schoenb. t. 425. Bullace; Muscadine.

Vittade'nia. (From *vitta*, a riband, and *aden*, a gland. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.) See **Erigeron**.

V. triloba. See *Erigeron mucronatus*.

Vitta'ria. (From *vitta*, a riband; shape of fronds. Nat. ord., *Filices*; Syn., *Tæniopsis*.)

Stove, brown-spored ferns, with grass-like fronds. See **FERNES**.

- V. angustifolia*. Malacca.
 — *elongata*. S. America.
 — *ensiformis*. May. Brazil.
 — *graminifolia*. 1. July. Brazil. 1820.
 — *lineata*. 2. August. S. America. 1793. Syn., *Tæniopsis lineata*.
 — *revoluta*. June. Nepal. Syn., *Tæniopsis revoluta*.
 — *scopolendrina*. 1½. New Guinea. Syn., *Tæniopsis scolopendrina*.
 — *zosterifolia*. S. America.

Vivia'nia. (Named after *Dr. Viviani*, a Swiss botanist. Nat. ord., *Geraniaceæ*; Tribe, *Vivianeæ*.)

Greenhouse, Chilean evergreens. Cuttings of young shoots in sand, under a bell-glass, in May; sandy loam and fibry peat. Winter temp., 45° to 50°; summer, 60° to 70°.

- V. grandiflora*. 2. Red. July. 1832.
 — *marifolia*. 2. Red. July. 1832.
 — *parviflora*. 2. White. July. 1832.

Voandzei'a. (Said to be from its Malagasy name, *Voandzon*. Nat. ord., *Leguminosæ*.)

Creeping, etove herb, which forces its seed-pods into the earth to ripen. For culture, see **ARACHIS**.

- V. subterranea*. ½. Pale yellow. July. Tropical Africa, etc. 1823. Bombarra Ground Nut; Underground Bean.

Vochy'sia. (From *Vochy*, the Guianese name of *V. guianensis*. Nat. ord., *Vochysiaceæ*. Syn. *Vochisia* and *Vochya*.)

Stove shrubs or trees. Compost of loam and peat. Cuttings.

- V. guianensis*. 12. Yellow. August. Guiana. 1822.
 — *tomentosa*. 25. Yellow. August. Guiana. 1826.

Volkame'ria. (After *Joh. Christoph Volkamer*, a botanist of Nürnberg, died 1720. Nat. ord., *Verbenaceæ*; Tribe, *Viticeæ*.) See **Clerodendron**.

- V. aculeata*. See *Clerodendron aculeatum*.
 — *angustifolia*. Andr. Rep. t. 554. See *Clerodendron heterophyllum*.
 — *buxifolia*. See *Clerodendron inerme*.

 — *inermis*. See *Clerodendron inerme*.
 — *japonica*. A synonym of *Clerodendron fragrans*.
 — *Kampferi*. See *Clerodendron squamatum*.

Voua'pa. (From the Guianese name. Nat. ord. *Leguminosæ*.)

Stove, evergreen tree. Sandy loam and a little peat. Cuttings.

- V. bifolia*. 10. Violet. May. South America. 1823. This is now known as **MACROLOBIUM BIFOLIUM**.

Vo'ya. (Guianese name. Nat. ord., *Gentianeæ*.)

Stove, herbaceous perennials. Seeds and divisions in spring; sandy loam, with decayed vegetable mould, or a little peat. Winter temp., 50° to 55°; summer, 60° to 80°.

- V. cœrulea*. Blue. June. Trinidad. 1824.
 — *rosea*. Red. July. Guiana. 1822.
 — *uniflora*. Yellow. June. W. Ind. 1824.

Vriesia. (Named after *Dr. de Vriese*, a Dutch botanist. Nat. ord., *Bromeliaceæ*; Tribe, *Tillandsiæ*.) See **Tillandsia**.

Many of the plants enumerated below have originated as garden hybrids, and have not received names under **TILLANDSIA**.

- V. Alberti*. A hybrid between *Tillandsia incurvata* and *Vriesia Morreniana*. Rev. Hort. 1889, p. 300.

 — *xiphostachys*. See *Tillandsia xiphostachys*.
- Vulneraria.** (From *vulnus*, a wound. Nat. ord., *Leguminosae*; Tribe, *Loteae*.) A synonym of *Anthyllis*.
V. rubriflora. A synonym of *Anthyllis vulneraria*, var. *rubriflora*.

W.

Wachendorfia. (Named after E. J. Wachendorf, a Dutch botanist. Nat. ord., *Hæmodoraceae*; Tribe *Euhæmodoraceae*.)

Greenhouse, South African bulbs; yellow-flowered, except where otherwise mentioned, and requiring the same treatment as the larger Ixias. They bloom in April.

- W. brevifolia*. 1. Purple. 1795. B. M. t. 1166.
 — *Bregnia* na. 1. 1825.
 — *graminea*. 1.
 — *Hibbertii*. 2. 1823.
 — *hirsuta*. 1½. Violet. 1687. B. M. t. 614.
 Syn., *W. villosa*.
 — *paniculata*. 2. 1700. B. M. t. 616 and t. 2610.
 — *tenuella*. 1. 1816.
 — *thyrsiflora*. 2. May. 1759. B. M. t. 1060.
 — *villosa*. Andr. Rep. t. 398. See *W. hirsuta*.

Waefer Ash. *Ptelea trifoliolata*.

Wahlenbergia. (Named after Dr. Wahlenberg, author of "Flora Laponica." Nat. ord., *Campanulaceae*.)

All are blue-flowered, except when otherwise mentioned. Seeds under a glass in the beginning of April, and planted out in the end of May; division of perennials, and cuttings of the young shoots in the beginning of summer, under a hand-light; sandy peat and loam, and a cool, moist situation.

GREENHOUSE ANNUALS, ETC.

- W. albo-marginata*. Ic. Pl. t. 818. See *W. saxicola*.
 — *capillaris*. May. N. Holland. 1824. Biennial.
 — *cernua*. Blue, white. July. Cape of Good Hope. 1804. Biennial.

Waileisia. (In honour of G. Wailes, Esq., a great cultivator of orchids. Nat. ord., *Orchideae*; Tribe, *Vandee-Cymbidieae*.) Now united with **Dipodium**.

Stove epiphytal orchid. See ORCHIDS.

- W. picta*. 1. Yellow, crimson. Java. 1849. Now known as **DIPODIUM PICTUM**.
 — *punctata*. 1-2. Red, purple. Australia. 1822. Now known as **DIPODIUM PUNCTATUM**.
 — *rosea*. A synonym of *Dipodium pictum*.

Wai'tzia. (In honour of M. Waitz. Nat. ord., *Compositae*. Syn., *Morna*.) Annuals of the Everlasting type. For cultivation, see **MORNA**.

- W. acuminata*. See *W. corymbosa*.
 — *au'rea*. 1-2. Golden-yellow. Summer. Australia. 1836. Syn., *Morna nitida*, B. R. t. 1941.
 — *corymbosa*. White, yellow. Swan River. 1864. B. M. t. 5443. Syn., *W. acuminata*.
 — *grandiflora*. Yellow. W. Australia. 1864. One of the finest.
 — *nivea*. 1½. White or pink. Summer. Australia. 1836. Syn., *Morna nivea*, B. R. 1838, t. 9.
 — *Sleeziana* na. Yellow. Swan River. 1861. Syn., *W. tenella*, B. M. t. 5342.
 — *tenuella*. See *W. Sleeziana*.

Wake Robin. *A'rum maculatum* and *Trillium grandiflorum*.

Waldsteinia. (Named after F. von Waldstein, a German botanist.)

Nat. ord., *Rosaceæ*; Tribe, *Potentilleæ*.
Syn., *Comaropsis*. Allied to *Geum*.)

Hardy herbaceous perennials. For culture, see *GEUM*.

W. Donia'na. 1. Yellow. May. N. America. 1800. Syn., *Comaropsis Doniana*.

— *fragrarioides*. 1. White. May. N. America. 1803. Syn., *Comaropsis fragrarioides* and *Dalibarda fragrarioides*. B. M. t. 1567.

— *geoi'des*. 3. Yellow. June. Hungary. 1804. B. M. t. 2595.

— *trifolia*. 4. Yellow. April. Eastern Europe.

Walke'ra. (Named after *Dr. R. Walker*, founder of the Cambridge Botanic Garden. Nat. ord., *Ochnaceæ*; Tribe, *Ochneæ*.)

Stove, yellow-flowered evergreens. Cuttings of half-ripened shoots, or firm side-shoots, in sand, under a bell-glass, in the beginning of April; sandy loam and peat. Winter temp., 50° to 60°; summer, 60° to 85°.

W. integrifolia. 12. Guiana.

— *serrata*. 12. Guiana. 1824.

Walking Leaf. *Scolopendrium rhizophyllum*.

Walks. See **Concrete and Gravel Walks.**

Wall-ress. *A'rabis*.

Wall Fern. *Polypodium vulgare*.

Wallflower. *Cheira'nthus*.

Wall'chia. (In honour of *Dr. Wallich*, once curator of the Calcutta Botanic Garden. Nat. ord., *Palmae*; Tribe, *Areceæ*.)

Moist stove palms, requiring a light, well-drained loam. Increased by suckers, which must be separated gradually, so as to induce them to root before being finally taken from the parent.

W. caryotoides. Yellowish-white. July. India. 1825.

— *densiflora*. Sikkim. Himalaya. B. M. t. 4584.

This is the same as *W. oblongifolia*.

Wallisia. See **Tillandsia.**

Wall Pennywort. *Cotyle'don Umbellatus*.

Wall Pepper. *Se'dum a'cre*.

Wall Rue. *Asple'nium Ru'ta-muraria*.

Walls are usually built in panels, from fifteen to thirty feet in length, one brick thick, with pillars at these specified distances, for the sake of adding to their strength, and the foundation a brick and a half thick. The plan of Mr. Silverlock, of Chichester, is worthy of adoption, since, if well constructed, it is equally durable, and saves one-third of the expense. Walls so constructed are stated to become dry after rain much more rapidly than a solid wall of the same or any other thickness, and there appears not a shadow of a reason why

they should not ripen fruit equally well. He forms the wall hollow, nine inches in breadth, by placing the bricks edgewise, so as to form two facings; they are laid in good mortar, and the joints carefully finished. They are placed alternately with their faces and ends to the outsides, so that every second brick is a tie, and in each succeeding course a brick with its end outward is placed on the centre of one laid lengthwise on either side. The top of the wall must be covered with a coping of stone or bricks projecting eight inches. It is strengthened at every twenty feet by piers of fourteen-inch work, built in the same manner, with bricks laid on edge.

In every instance a wall should never be lower than eight feet. The thickness usually varies with the height of the wall, being nine inches if it is not higher than eight feet; thirteen and a half inches, if above eight and under fourteen feet; and eighteen inches, from fourteen up to twenty feet.

Inclined or Sloping Walls have been recommended, but have always failed in practice. It is quite true that they receive the sun's rays at a favourable angle, but they retain wet, and become so much colder by radiation at night than perpendicular walls, that they are found to be unfavourable to the ripening of fruit.

The Flued-wall or Hot-wall is generally built entirely of brick, though, where stone is abundant and more economical, the back or north side may be of that material. A flued-wall may be termed a hollow wall, in which the vacuity is thrown into compartments *a a a*, to facilitate the circulation of smoke and heat from the base or surface of the ground, to within one or two feet of the coping. Such walls are generally arranged with hooks inserted under the coping, to admit of fastening some

description of protecting covers, and sometimes for temporary glass frames. A length of forty feet, and from ten to

fifteen high, may be heated by one fire, the furnace of which, *b*, being placed one or two feet below the surface of the ground, the first course, or flue, *c*, will commence one foot above it, and be two feet six inches or three feet high, and the second, third, and fourth courses, *d*, *e*, *f*, narrower as they ascend. The thickness of that side of the flue next the south or preferable side should, for the first course, be four inches, or brick and bed; and, for the other courses, it were desirable to have bricks cast in a smaller mould; say for the second course three, for the third two and three quarters, and for the fourth two and a half inches in breadth. This will give an opportunity of bevelling the wall, and the bricks being all of the same thickness, though of different widths, the external appearance will be everywhere the same.—*Enc. Gard.*

Walnut. *Ju'glans re'gia.*

Value'wa. (After *P. A. Walejew.* Nat. ord., *Orchideæ*; Tribe, *Vandee-Oncideæ.*)

Stove orchid. For culture, see GOMEZA.
W. pulch'ella. Yellow, purple. Brazil. 1892.

Wardian Case. See **Glass Case.**

Wa'rra. (Named after *F. Warre*, a botanical collector. Nat. ord., *Orchideæ*; Tribe, *Vandee-Cryptopodieæ.* Allied to *Grobya.*)

Stove orchids, grown in baskets. See ORCHIDS.

Washingtonia. (After *George Washington*, the American statesman. Nat. ord., *Palmæ*; Tribe, *Corypheæ.*)

Tall greenhouse palms. For culture, see CHAMÆROPS.

W. filifera. 30. California. Syns., *Brahea filamentosa*, *Pritchardia filamentosa* and *P. filifera.*

— *giga'ntea.* A synonym of *Sequoia gigantea.* (Nat. ord., *Conifereæ.*)

— *robu'sta.* 7. California. 1883. Rev. Hort. 1885, p. 403, fig. 73.

Water. The best for the gardener's purpose is rain water, preserved in tanks sunk in the earth, and rendered tight either by puddling, or bricks covered with cement. To keep these tanks replenished, gutters should run round the eaves of every structure in the garden, and communicate with them. Every hundred cubic inches of rain water contains more than four cubic inches of air, of which more than half is carbonic acid gas, and the remainder nitrogen and oxygen, in the proportion of sixty-two of the former to thirty-eight of the last named.

That obtained from ponds or springs frequently contains matters offensive or deleterious to plants. That known as hard water, containing an excess of salts of lime or magnesia, is invariably prejudicial, and pond water is scarcely less so. If it be stagnant, and loaded with vegetable extract, it is even worse than hard spring water; for it then contains carburetted hydrogen, and other matters noxious to vegetables. These last-named waters, if obliged to be employed to tender plants, should have a pint of the ammoniacal water of the gas-works, mixed thoroughly with every sixty gallons, an hour or two before they are used.

Water-cress. (*Nasturtium officinale.*) *Varieties.*—Small Brown-leaved, hardiest; Large Brown-leaved, best for deep water; Green-leaved, easiest cultivated.

Planting in Water.—The trenches in which they are grown are so prepared, that, as nearly as possible, a regular depth of three or four inches can be kept up. These trenches are three yards broad, and eighty-seven yards long, and whenever one is to be planted the bottom is made quite firm and slightly sloping, so that the water which flows in at one end may run out at the other. If the bottom of the trench is not sufficiently moist, a small body of water is allowed to enter to soften it. The cresses are

then divided into small sets or cuttings, with roots attached to them; and these are placed at the distance of three or four inches from each other. At the end of five or six days a slight dressing of well-decomposed cow-dung is spread over all the plants, and this is pressed down by means of a heavy board, to which a long handle is obliquely fixed. The water is then raised to the depth of two or three inches, and never higher. Each trench is thus replanted annually, and furnishes twelve crops during the season. In the summer the cresses are gathered every fifteen or twenty days, but less frequently during winter; care is taken that at each gathering at least a third part of the bed is left untouched, so that neither the roots may be exhausted, nor the succeeding gathering delayed. After every cutting, a little decayed cow-dung, in the proportion of two large barrow-fuls to each trench, is spread over the naked plants, and this is beaten down by means of the rammer above mentioned. After the water-cresses have been thus treated for a twelvemonth, the manure forms a tolerably thick layer at the bottom of the trench, and tends to raise its level. To restore it to its original level, all the refuse should be thrown out upon the borders which separate the trenches from each other. These borders may be planted with artichokes, cabbages, or cauliflowers.

Planting in Borders.—This must be done in September, and in a moist, shady border. Plant slips, and the only cultivation necessary is to dig the earth fine, to draw a slight trench with a hoe, to fill this with water until it becomes a mud, to cover it about an inch deep with drift sand, and then to stick in the slips about six inches apart, watering them until established. The sand keeps the plants clean. They will be ready for gathering from in a very few weeks, and the shoots should be invariably cut, and not picked. They are not so mild-flavoured as those grown in water, but then they are free from aquatic insects, etc.

Waterfall. See **Cascade.**

Watering Engine. See **Engine.**

Watering Pots. These should have roses pierced with very fine holes; the diameter of those usually used is too large. *Long-spouted* watering pots are required for watering plants in pots upon shelves. *French* watering pots have zig-zag bends in the spout, to break from the plant the force of the water. *Shelf* watering pots are small and flat-bodied,

for giving water to plants overhead, and near the glass in greenhouses or stoves.

The accompanying engraving is of a watering pot designed by Mr. G. Thompson, who states that its superiority consists in the roses being so formed as to give the water thrown from them the nearest resemblance to a gentle shower of rain, which renders it peculiarly suitable for watering seedlings or other tender plants. As the brass joints which connect the roses to the spout are made water-tight, there is no danger of its returning outside, to the annoyance.

of the person using it; *a* is the spout to which the roses are screwed; *b*, the box to contain either spout out of use; *c* and *d*, the holes in which the joints are placed; *e*, a large rose, for watering flower-beds; *f*, a smaller rose, for watering plants in pots.

Watering Pot, High-level. This instrument has been designed for watering plants on high shelves, or at the back of a bench or border, and rendering it unnecessary to remove the front rows of pots or to step upon the border. It consists (as shown in the annexed figure) of an ordinary watering-pot suspended between metal prongs attached to a long handle, somewhat resembling a pitchfork. On the front of this handle are screwed two rings, through which a cord attached to the spout of the pot is passed. The pot is so balanced as to remain vertical until by pulling the cord it can be tilted to the angle required to allow the water to pass out of the spout. It can be used with or without a rose.

Wel'fia. (Named in honour of the royal family (Guelph) of Hanover. Nat. ord., *Palmeæ*; Tribe, *Areceæ*. Allied to *Geonoma*.)

Stove palm. Seeds. Rich loam and leaf-mould, mixed with a little old cow-dung. Summer temp., 65° to 85°; winter, 60° to 70°.

W. regia. Amazons. 1869.

Wellingtonia. (In honour of the great Duke of Wellington. Nat. ord., *Coniferae*; Tribe, *Taxodiæ*.) See **Sequoia**.

This is the loftiest of known trees. Specimens are known with trunks 300 feet high, and 20 feet in diameter. It is an evergreen, and perfectly hardy.

W. gigantea. See *Sequoia gigantea*.

— *pyramidalis compacta*. Rev. Hort. 1891, p. 166. A garden variety of *Sequoia sempervirens*.

Welsh Nut. *Juglans regia*, the Walnut.

Welsh Onion. See **Ciboul**.

Welsh Poppy. *Meconopsis cambrica*.

Welwi'tschia. (Named in honour of Dr. Frederic Welwitsch, a talented botanical traveller. Nat. ord., *Gnetaceæ*.)

This truly remarkable plant is one of the wonders of the Vegetable Kingdom. It is a native of the elevated plateau near Cape Negro, in Western Tropical Africa, and of Damara Land; and only grows in dry arid places where rain hardly ever falls. It forms a short obconic trunk about two feet long, the greater part of which is buried in the earth, only rising above the soil a few inches. From the base of the trunk, roots run down very deep into the earth. The top is flat and rough, and somewhat two-lobed; in old plants it is often three to four feet in diameter. From a deep groove at the margin of each lobe proceed the two leaves—the only ones the plants ever has, and are the cotyledons or seed leaves. The leaves are six to eight feet long, or longer; they spread out on each side of the plant upon the ground, and in old plants are split up from apex to base into ribbon-like pieces. From the edge of the top of the trunk,

just within the leaves, arise the forked stems which bear the cones; these are produced in plenty, and their bright crimson-scarlet colour adds to the very remarkable appearance of the plant. Although it was first made known in Europe by Dr. Welwitsch, it appears to have been first discovered by Mr. C. J. Anderson, an eminent African traveller. This wonderful plant has been introduced into the Royal Gardens, Kew, but we do not know if it yet exists in any other establishment. It will probably prove very difficult to cultivate, on account of the impossibility of imitating the natural conditions under which it flourishes. It appears that the most probable method of succeeding with it would be to inclose a space within brick walls to a height of about three feet from the earth; this should be filled up to a height of about sixteen or eighteen inches with a very light porous soil, such as a mixture of light sandy loam and broken bricks, in the proportion of two parts of the former to one of the latter. Above this the space should be filled in with sand and brick rubbish mixed with a little sandy loam—about a tenth part of the latter, just to help to bind it. If planted in this way the long descending roots would penetrate into the lower soil, and derive sufficient nourishment and water from it, as the water would ascend into the lower stratum from the earth by capillary attraction, whilst the upper stratum, being dry, will prevent the plant from rotting. It should be fully exposed to the sun, and no water given it, though at evening a slight syringing over the leaves and crown would probably be beneficial, as this would in some way approach the dews to which it is subjected in its native country. The temperature should not be allowed to get below 50°.

W. mirabilis. Damara Land. 1863 and 1878. Trans. Linn. Soc. xxiv. 1-14; B. M. tt. 5368-9.

Wendla'ndia. (Named after J. C. Wendland, curator of the Botanic Garden, Hanover. Nat. ord., *Rubiaceæ*; Tribe, *Cinchoneæ*. Allied to *Hindsia*.)

Stove, white-flowered evergreens. Cuttings of the points of young shoots, or small young side-shoots, in sand, under a bell-glass, in May; sandy loam, fibry peat, and a little charcoal. Winter temp., 45° to 55°; summer, 60° to 80°.

W. paniculata. July. Malay. 1820.
— *populifolia*. See *Cocculus carolinus*.
— *tinctoria*. July. India. 1815.

Werne'ria. (Named after A. G. Werner, the celebrated mineralogist. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*. Allied to *Doronicum*.)

Half-hardy herbaceous. Division of the plant in spring; sandy loam, well-drained; requires a cool greenhouse or a cold pit in winter, or may be treated as an alpine plant, protected from severe frost and wet in winter.
W. rigida. ½. February. Quito. 1828.

Western Yew. *Taxus brevifolia*.

West Indian Cockspur. *Pisodia aculeata*.

West Indian Mugwort. *Parthenium Hystero-phorus*.

Westri'ngia. (Named after J. P. Westring, physician to the King of Sweden. Nat. ord., *Labiatae*. Allied to *Prostranthera*.)

Greenhouse evergreens, from Australia. Cuttings of half-ripened shoots in May, in sand, under a bell or hand-glass; sandy loam and leaf-mould. Winter temp., 35° to 45°.

Winter Cress. *Barbare'a.*

Winter Daffodil. *Sternbe'rgia lu'tea.*

Winter Garden. A term used to denote a large glass structure, in which sufficient heat is maintained to exclude frost during winter. It is usually of sufficient size to allow of the interior being laid out in paths, and beds in which to plant such showy evergreens as Camellias, Himalayan Rhododendrons, Bamboos, Palms, Tree-ferns, Araucarias, and numerous other plants from temperate regions. The pillars may be festooned with tea-roses and other climbing plants, and hardy bulbs may be liberally planted amongst the shrubs. When well done, such a garden should be a source of interest throughout the year, and a welcome rendezvous during the winter.

Winter-green. *Pyro'la.*

Winter-green, Aromatic or Creeping. *Gaulthe'ria procu'mbens.*

Winter-green, Chickweed. *Trienta'lis.*

Winter Hawthorn. *Aponoge'ton dista'chyon.*

Winter Moth. See *Cheimatobia.*

Winter Sweet. *Ori'ganum heracleo'ticum.*

Winter Wolf's Bane. *Era'nthis hyema'lis.*

Wire-Worms are the larvæ of various species of *Elatæ*, *Click Beetle*, or *Skip-Jack*. To remove the wire-worm from a soil, no mode is known but frequently digging it and picking them out, as their yellow colour renders them easily detected. To prevent their attack upon a crop, mix a little spirit of tar, or a larger quantity of gas-lime, with the soil. It has been stated that growing white mustard drives them away, and it is certainly worth the trial. To entrap them, and tempt them away from a crop they have attacked, bury potatoes in the soil near the crop; and if each potato has a stick thrust through it, this serves as a handle by which it may be taken up, and the wire-worms which have penetrated it be destroyed. To decoy them from beds of Anemone, Ranunculus, etc., it is said to be a successful plan to grow round the beds an edging of daisies, for the roots of which they have a decided preference.

Wista'ria. (Named after C. Wistar, an American professor. Nat. ord., *Leguminosæ.*)

Hardy deciduous, purplish-flowered climbers. Seeds when obtainable; cuttings of the strong roots; by cuttings of the young shoots, getting firm, under a hand-light, in sandy soil, but more generally by layers of long-ripened young shoots, as then almost every bud will form a plant. Sandy loam and peat.

 — *zeylanica.* 10. 1778. Syn., *W. antidysenterica*.

Wulfe'nia. (Named after *F. Wulfen*, a botanical author. Nat. ord., *Scrophulariaceæ*.)

Hardy herbaceous. Seeds and divisions in spring; light, rich soil, and a dry, elevated place in winter, or kept from damp in a dry, cool pit.

- W. Amherstiana.* 3. Lilac. July. Chinese Tartary. 1846.
 — *carinthi'aca.* 1½. Blue. July. Carinthia. 1817. B. M. t. 2500.
 — *Notonia'na.* See *Klugia Notoniana*.

Wulffia. (Named after *J. C. Wulff*, author of "Flora Borussia." Nat. ord., *Compositæ*. Allied to *Rudbeckia*.)

Stove perennial herb. Cuttings of young shoots in sandy soil, in spring or summer; sandy loam and leaf-mould. Winter temp., 45° to 58°; summer, 60° to 80°.

W. maculata. Yellow. June. Brazil. 1822. B. R. t. 662. Syn., *Gymnolomia maculatum*.

Wu'rmbea. (Named after *F. V. Wurmbe*, a Dutch naturalist. Nat. ord., *Liliacæ*; Tribe, *Anguillaricæ*. Allied to *Androcymbium*.)

Half-hardy or greenhouse bulbs, from South Africa, and all but one white-flowered. For culture, see *MELANTHIUM*. The three last are sometimes regarded as varieties of *W. campanulata*.

W. campanulata. ½. June. Syn., *Melanthium monopetalum*, B. M. t. 1291.

— *longiflora.* ¾. May. 1788.

— *pub'ula.* ½. May. 1800.

— *purpurea.* 1. Purple. May. 1788. Syn., *Melanthium spicatum*, B. M. t. 694.

Wych Elm. *U'lmus montana.*

Wye'thia. (After *N. B. Wyeth*, the discoverer of this genus. Nat. ord., *Compositæ*.)

Hardy perennial herbs. For culture, see *HELIANTHUS*.

W. angustifolia. ½-2. Yellow. Autumn. Rocky Mountains.

Wymot. *Althæa.*

X.

Xanthi'sma. (From *xanthisma*, yellowness; on account of its yellow flowers. Nat. ord., *Compositæ*; Tribe, *Asteroidææ*. Allied to *Haplopappus*.)

Hardy annual. Seeds in the open border in April.

X. texanum. 1-3. Yellow. Texas. 1877. B. M. t. 6275.

Xanthocephalum. (From *xanthos*, yellow, and *cephale*, a head; in the flower-heads are yellow. Nat. ord., *Compositæ*; Tribe, *Asteroidææ*.)

X. centauroides is a greenhouse sub-shrub, which may be increased by cuttings; *X. gymnospermoides* is a hardy annual by seeds.

X. centauroides. 1½. Yellow. Summer. Mexico. 1826. Syn., *Grindelia coronopifolia*.

— *gymnospermoides.* 2-4. Orange-yellow. September. New Mexico. 1859. Syn., *Gutierrezia gymnospermoides*, B. M. t. 5155.

Xanthoceras. (From *xanthos*, yellow, and *keras*, a horn; alluding to the yellow horn-like glands or nectaries between the petals. Nat. ord., *Sapindacææ*.)

A small hardy tree. It is difficult to propagate in any other way than from seeds, but root-cuttings sometimes succeed. Light garden-soil.

X. sorbifolia. White, purple. China. 1870.

Xanthochymus. (From *xanthos*, yellow, and *chymos*, juice; the plants

having abundant yellow juice. Nat. ord., *Guttiferæ*; Tribe, *Garciniæ*.)

Stove evergreen trees. For cultivation, see GARCINIA.

X. dulcis. 20. Creamy-white. February. Mollucca Islands. 1820. B. M. t. 3088.

— *ovalifolius*. E. Indies. Gamboge erroneously was supposed to be obtained from its sap. Syn., *Garcinia ovalifolia*.

— *pictorius*. 40. White. E. Indies. Syn., *Garcinia Xanthochymus*.

Xanthorhiza. Yellow Root. (From *xanthos*, yellow, and *rhiza*, a root. Nat. ord., *Ranunculaceæ*.)

Hardy evergreen shrub. Suckers; sandy loam and peat; does best in a moist situation.

X. apifolia. 3. Purple, green. February. N. America. 1766. B. M. t. 1736.

Xanthorrhæa. Grass-tree. (From *xanthos*, yellow, and *rheo*, to flow; yellow juice. Nat. ord., *Juncæ*; Tribe, *Xeroteæ*.)

Greenhouse, white-flowered plants, from Australia. For culture, see APHYLLANTHES.

X. australis. 3. 1824. Evergreen.

— *bracteata*. 2. 1810. Herbaceous.

— *haustilis*. 4. 1803. Evergreen. B. M. t. 4722.

Syn., *X. resinosa*.

— *humilis*. See *X. Pumilio*.

— *meadia*. 2. 1803. Evergreen.

— *minor*. 2. 1804. Herbaceous.

— *Preissii*. 1-8. Greenish-yellow. B. M. t. 6033.

— *Pumilio*. 2. 1825. Syn., *X. humilis*.

— *quadrangulata*. Greenish. S. Australia. 1874.

— *resinosa*. See *X. hastilis*.

Xanthosia. (From *xanthos*, yellow; the plants having a yellow down. Nat. ord., *Umbelliferæ*.)

Greenhouse shrubs. For cultivation, see TRACHYMENE.

X. pilosa. 1-2. White. S. E. Australia. Syns., *X. hirsuta* and *X. montana*. Trans. Linn. Soc. x., t. 22.

— *rotundifolia*. 1½. White. June. W. Australia. 1836. B. M. t. 3582.

Xanthosoma. (From *xanthos*, yellow, and *soma*, a body; the edible roots. Nat. ord. *Aroideæ*; Tribe, *Colocasiæ*. Allied to *Caladium*.)

Stove plants. For culture, see CALADIUM.

X. auriculatum. Spathe green, white; spadix white. Tropical America. 1869.

— *Barilleti*. 3. Brazil. Rev. Hort. 1882, p. 269, fig. 68.

— *belophyllum*. Yellow. Tropical America.

— *helleborifolium*. 1½-2. Spathe and spadix whitish. Tropical America. 1793.

Syns., *Acontias helleborifolius* and *Arum helleborifolium*.

— *Jacquinii*. Yellow. May. S. America. 1816. Evergreen.

— *Lindeni*. 1-1½. Spathe brownish-green outside, white within. Columbia. 1871. Syn., *Phyllotænium Lindeni*.

— *magnificum*. A robust variety. Syn., *Phyllotænium Lindeni*, var. *magnificum*.

— *maculata*. Syn., *Alocasia albo-violacea*.

— *Maximiliani*. 5. Purple-violet, whitish, green. Brazil. 1860.

— *mirabile*. Spathe pale yellow. Tropical S. America. 1874.

X. plu'mbea. See *Alocasia cuprea*.

— *robustum*. Yellow. Mexico.

— *sagittifolia*. White. May. W. Indies. 1710. Herbaceous.

— *violaceum*. White, yellow; leaf-stalks purple. Tropical America. 1864.

— *Wallisii*. Leaves green, with whitish veins. Antioquia. 1869.

Xanthoxylum. See *Zanthoxylum*.

Xeranthemum. (From *xeros*, dry, and *anthos*, a flower; everlasting flower. Nat. ord., *Compositæ*; Tribe, *Inuloidæ*.)

The flowers, after being dried, may be dyed of any colour. Hardy annuals. Seeds in the open border in April.

X. annuum. 3. Purple. July. South Europe. 1570.

— *cane'scens*. B. M. t. 420. See *Helipterum canescens*.

— *erectum*. White. June. Persia. 1836.

— *fulgidum*. B. M. t. 414. See *Helichrysum fulgidum*.

— *herbaceum*. Andr. Rep. t. 487. See *Helichrysum squamosum*.

— *inapertum*. 2. Purple. July. South Europe. 1620.

— *longipapposum*. White. June. Persia. 1836.

— *orientale*. See *Chardinia xeranthemoides*.

— *rigidum*. Andr. Rep. t. 387. See *Helichrysum striatum*.

— *sesamoides*. B. M. t. 425, and var. *sulphureum*. B. M. t. 763, are synonyms of *Helipterum sesamoides*.

Xerone'ma. (From *xeros*, dry, and *nema*, a thread; because the filaments of the stamens dry up and persist. Nat. ord., *Liliacæ*; Tribe, *Asphodeleæ*. Allied to *Anthericum*.)

A beautiful stove herbaceous perennial, with the foliage and habit of an iris. Seeds, and divisions of the rootstock. Rich, sandy loam and leaf-mould. Summer temp., 60° to 80°; winter, 55° to 65°.

X. Modrei. 1½. Crimson. New Caledonia. 1878. G. C. 1878, x. p. 17.

Xerophyllum. (From *xeros*, dry, and *phyllon*, a leaf; dry, grassy leaves. Nat. ord., *Liliacæ*; Tribe, *Nartheciæ*. Allied to *Helonias*.)

White-flowered, herbaceous perennials, from North America. Seeds and division of the plant in spring. A rather moist, peaty border suits them best. *X. Sabadii* requires a stove.

X. asphodeloides. 1. May. 1765. Syns., *X. setifolium*, B. R. t. 1613, and *Helonias asphodeloides*, B. M. t. 748.

— *gramineum*. See *Stenanthium angustifolium*, var. *gramineum*.

— *Sabadii*. 3. Vera Cruz. 1830.

— *tenax*. 1½. May. 1811. Syn., *Helonias tenax*.

Xerophyta. (From *xeros*, dry, and *phyton*, a plant; dry plant. Nat. ord., *Amaryllidæ*; Tribe, *Velloziæ*.) See *Vellozia*.

Stove perennial. Seeds; suckers. Sandy loam, mixed with a little brick-rubbish. Care must be taken not to overwater the plants. Summer temp., 65° to 85°; winter, 60° to 70°.

X. retinervis. See *Vellozia retinervis*.

Xerotes. (From *xerotes*, dryness; the nature of these plants. Nat. ord., *Juncaceæ*; Tribe, *Xeroteæ*.)

Greenhouse, perennial herbs. Rich, light soil. Divisions.

X. longifolia. 3. Greenish-white. June. Australia. 1798. B. E. 1838, t. 3. Australian Tussock Grass.

— *rigida*. 1. Greenish-white. June. Australia. 1791. B. C. t. 798.

Ximenesia. (Named after J. Ximenes, a Spanish apothecary. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Yellow-flowered, Mexican plants. Annuals, by seeds in the open border in April; perennials, also, by division of the plant in spring, and these, in general, will want the protection of a dry, cool pit in winter.

ANNUALS.

X. Cavanillei. A synonym of *Echinacea heterophylla*.

— *foetida*. 2½. August. 1824. A synonym of *Encelia foetida*.

— *heterophylla*. 2. July. 1827. A synonym of *Encelia heterophylla*.

HERBACEOUS PERENNIALS.

X. cordata. 3. September. 1826. A synonym of *Encelia cordata*.

— *enceloides*. See *Verbesina enceloides*.

Xime'nia. (Named after F. Ximenes, a Spanish naturalist. Nat. ord., *Olacaceæ*.)

Stove or greenhouse shrubs or trees. Cuttings of half-ripened shoots in sand, under a glass, in May, and in bottom-heat; sandy, fibry peat, and lumpy loam. Winter temp., 55° to 60°; summer, 60° to 85°.

X. americana. 15. Yellowish. Tropics. 1759.

— *incarnata*. 40. White. Jamaica. 1810.

— *lanceolata*. Yellow. April. China. 1820.

— *oblongifolia*. Green. June. Australia. 1823.

Xiphi'dium. (From *xiphos*, a sword; sword-like leaves. Nat. ord., *Hæmodoraceæ*; Tribe, *Hæmodoreæ*. Allied to *Wachendorfia*.)

Stove, West Indian, herbaceous perennials. Divisions of the plant as fresh growth commences; rich, fibry loam and fibry peat, and a small portion of charcoal and sand. Winter temp., 50° to 58°; summer, 60° to 85°.

X. floribundum. 1. White. S. America. 1845.

— *album*. 1½. White. 1787.

— *cæruleum*. 1½. Blue. 1793.

— *giganteum*. White. October. 1845.

Xiphion. (From *xiphion*, a corn-flag. Nat. ord., *Irideæ*; Tribe, *Moraceæ*.)

These are the Irises with bulbous rootstocks. For cultivation, see IRIS. A full account of this genus is given by Professor M. Foster in the Journal of the Royal Horticultural Society, 1893.

X. filifolium. 2. Violet, yellow. Spain and Morocco. 1869. B. M. t. 5923.

— *histris*. ¾. Purple, yellow. Mount Lebanon. 1873. B. M. t. 6033.

— *ju'nceum*. 1½. Yellow. July. Algeria. 1869. Syn., *Iris juncea*. B. M. t. 5890.

— *Kolpakowskiana*. ½. Violet-purple, lilac, yellow. Spring. Turkestan. 1878. B. M. t. 6489. Syn., *Iris Kolpakowskiana*.

X. planifolium. ½. Lilac, yellow. Algeria. Syn., *Iris alata*.

— *reticulata*. ½. Violet-purple, yellow. Asia Minor. Syn., *Iris reticulata*. B. M. t. 5577. See G. C. 1885, xxiii., p. 607.

— *Sisyri'nchium*. Blue-purple, yellow. S. Europe. Syn., *Iris Sisyri'nchium*.

— *tingita'num*. 2. Violet - purple, yellow. Morocco. 1872. Syn., *Iris tingitana*. B. M. t. 6775.

— *vulga're*. 1-2. Violet-purple. June. Spain. Syn., *Iris Xiphium*. B. M. t. 666.

Xiphop'teris. Sword Fern. (From *xiphos*, a sword, and *pteris*, a fern. Nat. ord., *Filices*.) Now united with **Poly-podium**.

Stove, brown-spored ferns. See FERNS.

X. heterophylla. ½. June. N. Holland 1824.

— *myosuroi'des*. June. W. Indies. 1824.

— *serrulata*. ½. June. W. Indies. 1823.

Xylo'bium. (From *xylon*, wood, and *bios*, life; plants growing on wood. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Maxillariæ*.)

Stove, epiphytal orchids. For culture, see MAXILLARIA.

X. Colleyi. Reddish-brown with purple spots. Trinidad. Syn., *Maxillaria Colleyi*.

— *conca'vum*. ¾. Pale yellow. June. Guatemala. 1844. Syn., *Maxillaria concava*.

— *corruga'tum*. Pale brownish-purple; lip pale yellow with purple veins. Venezuela. 1844. Syn., *Maxillaria corrugata*.

— *de'color*. 1. Sulphur, white. Jamaica. Syn., *Maxillaria decolor*. B. M. t. 3981.

— *elonga'tum*. 1. Pale yellow; lip purplish-brown. Central America. 1847. Syn., *Maxillaria elongata*.

— *fovea'tum*. 1. Pale straw-colour. Demerara. 1839. Syn., *Maxillaria foveata*.

— *leontoglo'ssum*. 1-3. Yellow with red spots. March. New Grenada. B. M. t. 7085. Syn., *Maxillaria leontoglossa*.

— *pallidi'florum*. 1. Pale sulphur, whitish. Venezuela. 1826. *Maxillaria pallidiflora*. B. M. t. 2866.

— *squa'lens*. 1. Flesh-colour, with purple stripes; lip dark purple. Brazil. 1828. Syn., *Maxillaria squalens*. B. M. t. 2955.

Xylome'lum. (From *xylon*, wood, and *melon*, an apple; in allusion to the woody fruit. Nat. ord., *Proteaceæ*.)

Greenhouse shrub. Allied to LAMBERTIA, to which refer for cultivation.

X. pyriforme. New S. Wales. 1869.

Xylophy'lla. (From *xylon*, wood, and *phyllon*, a leaf; texture of the leaves. Nat. ord., *Euphorbiaceæ*; Tribe, *Phyllanthææ*.) See **Phyllanthus**.

Stove, yellow- and red-flowered evergreens, from Jamaica, unless otherwise mentioned. For culture, see PHYLLANTHUS.

X. angustifolia. See *Phyllanthus angustifolius*.

— *elongata*. B. C. t. 1091. See *Phyllanthus angustifolius*.

— *falcata*. B. E. t. 373. See *Phyllanthus falcatus*.

— *latifolia*. B. M. t. 1021. See *Phyllanthus speciosus*.

— *montana*. B. M. t. 2652. See *Phyllanthus angustifolius*.

X. obovata. See *Phyllanthus obovatus*.
— *speciosa*. See *Phyllanthus speciosus*.

Xylo'pia. (From *xylon*, wood, and *piéron*, bitter; the wood and fruit of *X. gla'bra* are called Bitterwood in the West Indies. Nat. ord., *Anonaceæ*.)

Stove trees or shrubs. Cuttings of firm, stubby side-shoots one year old, with most of the leaves adhering, in sand, under a bell-glass; sandy loam and fibry peat. Winter temp., 50° to 55°; summer, 60° to 85°.

X. frutescens. 4. Guiana. 1823.

— *glabra*. 40. Jamaica. 1820.

— *muricata*. 4. W. Indies. 1779.

Xy'ris. (A name used by Dioscorides for *Iris fetidissima*. Nat. ord., *Xyrideæ*.)

Stove, grass-like perennial. Light rich soil. Divisions.

X. altissima. B. C. t. 1900. A synonym of

Bobartia spathacea.

— *operculata*. 1. Whitish; bracts black.

June. Australia. 1804. B. M. t. 1158.

Xysmalo'bium. (From *xysma*, a fragment, and *lobos*, a division; the corona is finely divided. Nat. ord., *Asclepiadaceæ*.)

Warm greenhouse perennial herb, requiring the same treatment as GOMPHOCARPUS.

X. padifolium. 3. Purplish-green, yellowish. South Africa. 1867. Syn. *Gomphocarpus padifolius*. Ref. Bot. t. 254.

Y.

Yacca-wood Tree. *Podocarpus Purdieana*.

Yam. *Dioscorea*.

Yang-mae Tree. *Myrica Nagei*.

Yarrow. *Achillea*.

Yarrow, Soldier's. *Stratoides aloides*.

Yate, or Yeit Tree. *Eucalyptus cornuta*.

Yellow Archangel. *Lamium Galeobdolon*.

Yellowby. *Chrysanthemum segutum*.

Yellow Cress. *Barbarea praecox*.

Yellow Elder. *Tecoma stans*.

Yellow Everlasting Flower. *Helichrysum arenarium*.

Yellow Garden Hawk Weed. *Toxipis barbata*.

Yellow Iris. *Iris Pseudocorus*.

Yellow Larkspur. *Tropaeolum*.

Yellow Battle. *Rhinanthus Cristagalli*.

Yellow Rocket. *Barbarea vulgaris*.

Yellow Star Flower. *Sternbergia lutea*.

Yellow Star of Bethlehem. *Gagea lutea*.

Yellow Sultan. *Centauria suaveolens*.

Yellow Water Lily. *Nuphar luteum*.

Yellow Water Lily Fly. *Lispe tentaculata*. This insect is about a quarter of an inch long, and half an inch across the wings. Its body is black, covered with ash down on the back, the head is gilded, the wings grey, and

the abdomen has three whitish triangular spots. It deposits its eggs on the petals of *Nuphar luteum*. These eggs, which are united into bundles, often as many as 100 to a bundle, are oblong, and when highly-magnified exhibit a finely reticulated surface.

Yellow Weed, Dyer's. *Reseda luteola*.

Yellow Wood. *Cladrastis tinctoria*, *Ochrosia borbonica* and *Podocarpus*.

Yellow Wort. *Blackstonia perfoliata* (Syn., *Chloera perfoliata*.)

Yew. *Taxus*.

Yew, Chinese. *Podocarpus chinensis*.

Yew, Clustered-flowered. *Cephalotaxus*.

Yew-Gall and Yew-bud Mite. At the termination of the shoots of Yew-trees are often to be found rather large galls, resembling in general appearance miniature artichokes (Fig. 1); they are formed of a large number of densely packed imbricating leaves, and are caused by the attacks of the larva of a small two-winged fly, named *Cecidomyia*

ta'xi. The fly, which does not appear until June, is about one-sixth of an inch long, and about one-third of an inch in expanse; the thorax, antennæ, and legs are ochreous, the abdomen is orange-yellow, and the wings pale greyish. It deposits its eggs in June in

the young growing buds. The larvæ, when hatched, eat into the centre of the bud, causing an arrest of its growth, and gradually it develops into a gall instead of forming a leafy shoot. Inside the gall the yellowish larva passes the winter, changing to the pupa stage in April or May of the following spring. The chrysalis at first is pale, but gradually becomes of a deep brown with age. In June the chrysalis pushes through the top of the gall, and the perfect fly emerges.

The buds of the Yew-tree are also attacked and their growth disturbed by a minute mite, shown at Fig. 2, greatly magnified. We have not seen this mite ourselves, but have borrowed our account and figure of it from the "Gardeners' Chronicle," 1875, iii. p. 659, where it is stated to be causing considerable damage to the hedges of Yew-trees at South Kensington "by injuring the buds, many of which were going black and decaying."

It is described under the name of *Tetranychus ta'xi*; it is "fleshy, milk-white, and translucent, and it has no eyes." The specimens examined had but four legs, and were thought to be "the young of a six-legged, or possibly an eight-legged species." The tail is furnished with two minute bristles.

Where Yew-trees are attacked so severely as to injure their growth to any great extent, either by the *Cecidomyia* or the *Tetranychus*, the only remedy is to hand-pick the galls and the mite-infested buds, and destroy them by burning. In the case of the galls they should be picked and destroyed in the month of March or April whilst the insect is still in a larval state. In the case of the

mite-infested buds we should recommend that they be destroyed as soon as detected.

Yu'cca. Adam's Needle. (Name of the plant in Peru. Nat. ord., *Liliaceæ*; Tribe, *Draceneæ*.)

All whitish-flowered evergreens. Sometimes by seeds, sown immediately they are ripe in a slight hotbed; generally by suckers, but also, at times, from young shoots that branch from the stems; deep, dry, sandy loam is their favourite soil; a few require the assistance of a stove or greenhouse, but most of them stand the open air in England. *Y. aloifolia* is, perhaps, the tenderest of all the hardy ones. They flourish near the sea-shore. We may add, that they seem quite at home on a knoll, or on rock-work.

Z.

Zacintha. (From *Zacanthus*, the ancient name of *Zante*, where this plant was first discovered. Nat. ord., *Compositæ*.)

Hardy annual herb. Seeds sown in the open border in April.

Z. verrucosa. ½-1. Yellow. Summer. Mediterranean region. Sibth. Fl. Gr. t. 820.

Zalacca. (From the Malayan name. Nat. ord., *Palmæ*; Tribe, *Lepidocaryæ*.)

Stemless stove palms. For cultivation, see CYCAS.

- Z. Blumeana*. See *Z. edulis*.
 — *edulis*. Malay Archipelago. 1847. Syns.,
 Z. Blumeana and *Calamus Zalacca*.

Zaluzia'nskya. (Named after Dr. Adam Zaluziansky, a botanist of the seventeenth century. Nat. ord., *Scrophulariaceæ*.)

Half-hardy annuals except *Z. lychnidea*, which is a greenhouse sub-shrub. Seeds sown in a warm frame in March or April, or cuttings in autumn. Sandy loam and peat. Winter temp. not below 45°.

- Z. capensis*. ½-1. Whitish. Spring. South Africa.
 — *selaginoides*. ½-1. Yellow, white. May. Cape of Good Hope. 1854.
 — *lychnidea*. ½-1. Pale yellow. Summer. South Africa. 1776. Syns., *Eritrus lychnidea*, B. M. t. 2504, and *Nycteria lychnidea*.

Zamia. (From *zamia*, loss; the barren appearance of the male flowers. Nat. ord., *Cycadaceæ*.)

A race of plants intermediate in habit between Ferns and Palms. Those not otherwise specified are from South Africa, and will succeed in a greenhouse; but all do best in a stove. Suckers; rich, loamy soil. Winter temp., 45° to 55°; summer, 60° to 80°.

- Zamioculcas.** (A name compounded of *Zamia*, and *Culcas*, an Arabic name for *Colocasia*; in allusion to its being an Aroid with *Zamia*-like leaves. Nat. ord., *Aroidæ*; Tribe, *Zamioculcastæ*. Syn., *Gonatopus*.)

Stove herbaceous evergreens. Remarkable among Aroids for having pinnate leaves. Divisions of the plant at the root; young plants may also be obtained from the leaflets after they have disarticulated from the rachis, as follows:—Place some leaflets upon some soil, which must be kept damp; in a few days the basal ends of the leaflets commence to swell, and each forms after a short time a small tuber. The tuber with the leaf attached may then be planted in a small pot, but should only just be covered with earth; roots and leaf-buds quickly form, and soon a young plant is established. Sandy loam and leaf-mould, mixed with bits of broken charcoal. Moist atmosphere. Summer temp., 66° to 85°; winter, 60° to 70°.

Z. Boivini. 3. Spathe greenish-yellow, brown; spadix greenish-yellow. Zanzibar. 1873. B. M. t. 6026. Syn., *Gonatopus Boivini*.
— *Loddigei*. 14. Spathe green. Zanzibar. 1828. B. M. t. 5985. Syn., *Caladium zamicefolium*.

Zano'nia. (After James Zanoni, once superintendent of the Botanic Garden at Bologna. Nat. ord., *Cucurbitaceæ*.) See **Alsomitra**.

Z. sarcophylla. See **Alsomitra sarcophylla**.

Zanthoxylum. Toothache-tree. (From *xanthos*, yellow, and *xylon*, wood. Nat. ord., *Rutaceæ*; Tribe, *Zanthoxyloceæ*. Syn., *Xanthoxylum*.)

Nearly all white-flowered; cuttings in sand, under a bell-glass, in May; the stove species in heat; the hardy species by seed, pieces of the roots, and cuttings of the ripened shoots in sandy soil, under a hand-light; sandy loam suits any of them.

HARDY DECIDUOUS.

Zapa'nia. (After Paul Ant. Zappa, once curator of the Gardens at Pavia. Nat. ord., *Verbenaceæ*.) See **Lippia**.

Z. nodiflora. See **Lippia nodiflora**.

Zauschneria. (Named after M. Zauschner, a German. Nat. ord., *Onagraceæ*. Allied to *Epilobium*.)

A hardy plant, with the habit of a Fuchsia. Division of the plant in spring; cuttings of the shoots in spring, summer, and autumn, under a hand-light. It is a good pot and hedging-plant; for the latter purpose, as the flowers are apt to drop too much, mix it with *Cuphea strigillo'ea*; rich, light soil.

Z. californica. 3. Bright scarlet. June. Santa Cruz. 1847.

— *latifolia*. A small form with broader leaves. B. M. t. 4493.

Ze'a. Maize, or Indian Corn. (From *zao*, to live; a food-plant. Nat. ord., *Gramineæ*; Tribe, *Maydeæ*.)

Annuals. Seeds in a slight hotbed in early spring, and the seedlings planted out into good soil. The heads, when half-grown and green, make an excellent vegetable when boiled. Most of the following are garden varieties of *Z. Maïs*.

Z. Cura'gua. 1. June. Chili. 1824.

— *gigantea foliis-variegata*. Leaves variegated with silver, white, and green.

— *tunica'ia foliis-variegatis*. A garden variety with variegated leaves. Wien. Gartz. 1891, p. 457.

Zebra Plant. *Calathea zebri'na*.

Zebra Wood. *Myrtus fragrans* and *Guetta'nda speciosa*.

Zebri'na. (Because the leaves are striped after the manner of a Zebra. Nat. ord., *Commelinaceæ*; Tribe, *Tradescantieæ*. Allied to *Tradescantia*.)

Stove or greenhouse herbaceous perennial, of creeping habit, with handsome white-striped leaves, purple beneath. It makes a good basket-plant, and is also useful for covering the earth of very large pots or tubs, or as an edging in suitable places. Easily increased by cuttings, which root very quickly. Rich light soil. Summer temp., 65° to 80°; winter, 55° to 65°.

Z. pendula. Purple. Summer. Mexico. 1849. Syns., *Cyanotis vittata*, *Tradescantia tricolor*, and *T. zebri'na*.

Zehne'ria. (In memory of Joseph Zehner, a German artist. Nat. ord., *Cucurbitaceæ*.)

Greenhouse climbers. For cultivation, see **SECIUM**.

Z. hastata. Leaves silvery-veined. Japan. 1866.

— *scabra*. Yellowish. South Africa. Syn., *Melothria punctata*.

— *sua'vis*. Cape of Good Hope.

Zelko'va. (Probably from the native name. Nat. ord., *Urticaceæ*; Tribe, *Ulmecæ*.)

Hardy deciduous trees.

Z. acuminata. Green. April. Caucasus. Syns., *Planera acuminata* and *P. japonica*.

— *crenata*. 12. Greenish. April. North America. 1760. Syn., *Planera Richard* and *Ulmus nemoralis*.

Zeno'bia. (A queen of Palmyra. Nat. ord., *Ericaceæ*. Allied to *Andromeda*.)

Hardy shrub, almost evergreen. Seeds and layers. Sandy loam and peat.

Z. speciosa. 2. White. Summer. N. America. 1800. Syns., *Andromeda cassinifolia*, B. M. t. 970, and *A. speciosa*.

Z. pulverulenta. Leaves glaucous above, silvery beneath. Syns., *Andromeda dealbata*, B. R. t. 1010, and *A. pulverulenta*, B. M. t. 667.

Zephyranthes. (From *zephyr*, the west wind, and *anthos*, a flower. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllææ*. Allied to *Habranthus*.)

Half-hardy bulbs, with only one flower on a stalk. For culture, see *HABRANTHUS*.

— *Molly*. A form of *Kennedya coccinea*.

— *panno'sa*. Paxt. Mag. viii. p. 147. A synonym of *Kennedya coccinea*.

— *seri'cea*. See *Kennedya sericea*.

— *tri'color*. B. R. 1835, t. 52. See *Kennedya coccinea*.

— *villo'sa*. B. R. 1842, t. 63. See *Kennedya coccinea*.

Zie'ria. (Named after *M. Zier*, a Polish botanist. Nat. ord., *Rutaceæ*. Allied to *Boronia*.)

Greenhouse, white-flowered evergreens, from Australia. For culture, see *BORONIA*.

Z. arbore'scens. B. M. t. 1395. See *Z. Smithii*, var. *macrophylla*.

— *hirsu'ta*. See *Z. pilosa*.

— *laevig'ata*. 3. June. 1822. Paxt. Mag. ix. p. 77. Syn., *Z. revoluta*.

— *lanceola'ta*. See *Z. Smithii*.

— *macrophy'lia*. B. M. t. 4451. See *Z. Smithii*, var. *macrophylla*.

— *microphy'lia*. 3. June. 1822.

— *obcord'a'ta*. 4. June. 1824.

— *octa'ndra*. 5. Green. 1825.

— *pauco'flora*. See *Z. pilosa*.

— *pilo'sa*. 4. June. 1822. Linn. Trans. x. t. 17. Syn., *Z. pauciflora*.

— *revolu'ta*. June. 1824.

— *Smi'thii*. 4. 1808. Syn., *Z. lanceolata*, B. C. t. 878.

— *macrophy'lia*. A large variety, sometimes forming a small tree. 1806. Syns., *Z. arbore'scens*, B. M. t. 1395, and *Z. macrophylla*, B. M. t. 4451.

Zi'ngiber. Ginger. (From the Indian name. Nat. ord., *Scitamineæ*; Tribe, *Zingiberææ*.)

Stove herbaceous perennials, from the East Indies; yellow-flowered, where not otherwise mentioned; division of the roots; fibry peat and sandy loam. Winter temp., 40° to 45°; summer, 80° to 90°. See *GINGER*.

Z. Ama'ricans. 3. Penang. 1846.

Zi'nnia. (Named after *J. G. Zinn*, a German professor of botany. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Mexican annuals. Seeds in April in a hothed; seedlings hardened off, and then transferred to the flower-garden, in good, rich, loamy soil. If sown earlier, they are apt to be drawn and attacked by insects. We have had them fine by sowing under a hand-light, without bottom-heat, in the middle of April, and throwing a mat over the glass at night.

- Z. angustifo'lia*. 2. Scarlet. July. 1824.
 — *au'rea*. Orange. 1862.
 — *e'legans*. 2. Scarlet. July. 1796. Jacq. Ic. t. 589.
 — *cocci'nea*. 2. Scarlet. August. 1829. Syn., *Z. violacea* var. *coccinea*. B. R. t. 1294.
 — *Darwi'ni*. A garden hybrid.
 — *fo're ple'no*. A double-flowered variety. 1861.
 — *viola'cea*. Purplish-violet. Syns., *Z. elegans* of B. M. t. 527, and *Z. violacea*, Andr. Rep. t. 55.
 — *Haagea'na*. 1-1½. Golden or orange-yellow. Summer. Central America? 1862.
 — *hy'brida*. 2. June. 1818.
 — *linea'ris*. 1½. Deep orange. Gfl. 1887, p. 667, fig. 171.

 — *cocci'nea*. See *Z. elegans* var. *coccinea*.

Ziza'nia. (From *Zizanon*, the Greek name for some wild grain; it is translated "tares" in the New Testament. Nat. ord., *Gramineæ*.)

Hardy grass of little horticultural value.

- Z. aqua'tica*. A tall aquatic grass with a large panicle. The grain is used by the Indians of N. W. America as food. N. W. America. 1836. Canadian or Indian Rice; Water Oats.

Zizi'phora. (From *zizi*, of the Indians, and *phoreo*, to bear. Nat. ord., *Labiatae*. Allied to *Monarda*.)

Red-flowered, where not otherwise mentioned. Annuals, by seed in April; perennials, by seeds, divisions, and cuttings; dry, sandy loam, in elevated places, such as rock-works; the perennials require a little protection in winter.

HALF-HARDY EVERGREENS.

- Z. acinoi'des*. ½. July. Siberia. 1786. Deciduous.
 — *clinopodioi'des*. ¾. Pink. June. Siberia. 1821.

- Z. clinopodioi'des can'e'scens*. July. 1803.
 — *me'dia*. ½. July. Caucasus. 1822. Syn., *Z. serphyllacea*. B. M. t. 906.
 — *dasy'ntha*. ½. July. Siberia. 1803. Syn., *Z. Pouschkini*. B. M. t. 1093.
 — *Pou'schkini*. See *Z. dasy'ntha*.
 — *serpylla'cea*. See *Z. clinopodioi'des*, var. *media*.

ANNUALS.

- Z. capita'ta*. ½. July. Syria. 1752.
 — *hispa'nica*. ½. June. Spain. 1759.
 — *tau'rica*. ½. Red, purple. August. Tauria. 1816.
 — *tenu'lor*. ¾. Purplish. June. Levant. 1752.

Zi'zyphus. (The Egyptian name of *Z. Lo'tus*. Nat. ord., *Rhamnaceæ*; Tribe, *Zizyphaceæ*.)

Greenish-yellow-flowered, where not otherwise mentioned. Cuttings of the roots, suckers, and cuttings of ripened shoots under a handy-light or bell-glass, according as the species are hardy or tender; deep, dry loam for the hardy, peat and sandy loam for the tender.

HARDY DECIDUOUS, ETC.

- Z. flexuo'sa*. 6. Nepaul. 1820.
 — *inci'ru'a*. 5. Nepaul. 1823.
 — *Ju'juba*. 40. April. N. Africa and India. 1759. Jujube Tree. Greenhouse Tree.

STOVE EVERGREENS, ETC.

- Z. Caracu'ta*. E. Ind. 1820.
 — *longifo'lia*. India. 1837.
 — *melastomoi'des*. 6. N. Holland. 1824.
 — *mucrona'ta*. 30. South Africa. 1810. Greenhouse.
 — *Nape'ca*. 15. Ceylon. 1816.
 — *ni'tida*. 6. June. China. 1822.
 — *spi'na Chri'sti trine'rvia*. E. Ind. 1821.

EXCLUDED SPECIES.

- Z. myrtoi'des*. See *Condalia microphylla*.
 — *Paliu'rus*. B. M. t. 1893. See *Paliurus aculeatus*.

Zomica'rupa. (From *zoma*, a kind of skirt, and *karpos*, fruit; referring to the pericarp of the fruit, which, when ripe, bursts at the bottom and remains covering the seeds like a skirt. Nat. ord., *Aroidæ*; Tribe, *Zomicarpeæ*.)

Stove tuberous-rooted perennials. For cultivation, see STAUROSTIGMA.

- Z. Pytho'nium*. 1. Glaucous-violet, green. Brazil. 1860.
 — *Riedelia'na*. 1. Green. Brazil. 1860.
 — *Steigeria'na*. 1. Blackish-purple. Brazil. 1860.

Zomicarpe'lla. (Diminutive of *Zomicarpa*. Nat. ord., *Aroidæ*; Tribe, *Zomicarpeæ*.)

Stove aroid.

- Z. macula'ta*. Leaves dark green, spotted with pale green. Spathe dull olive green. New Grenada. 1831.

Zo'rnia. (Named of *J. Zorn*, a German botanist. Nat. ord., *Leguminosæ*; Tribe, *Hedysareæ*.)

Annuals, seeds in a hothed, and the plants afterwards bloomed in the greenhouse; peren-

nials, also, by seeds, and dividing the plants in spring, and requiring to be kept from frost, and rather dry in winter; rich, light, fibry loam.

- Z. angustifolia*. 1. Purple. July. India. 1738. Annual.
 — *capensis*. $\frac{1}{2}$. Yellow. July. Cape of Good Hope. 1824. Greenhouse perennial.
 — *elegantis*. See *Dicerma elegans*.
 — *pulchella*. See *Desmodium pulchellum*.
 — *tetraphylla*. $\frac{3}{4}$. Yellow. July. Carolina. 1824. Greenhouse perennial. Syns., *Anonymos bracteata*, *Myriadenus tetraphyllus* and *Ornithopus tetraphyllus*.

Zosterostylis. (From *zoster*, a ribbon, and *stylis*, a column. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Daurideæ*.)

Stove orchid. For cultivation, see ORCHIDS.

- Z. arachnitis*. Green, purple. Ceylon. 1863. Syn., *Cryptostylis arachnacea*.

Zuccagnia. (After *A. Zuccagni*, once Director of the Botanic Gardens at Florence. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*.) A synonym of **Dipcadi**.

Z. viridis. A synonym of *Dipcadi viridis*.

Zygadenus. (From *zygnuo*, to join, and *aden*, a gland; double glands on the perianth. Nat. ord., *Liliaceæ*; Tribe, *Veratrea*. Allied to *Veratrum*.)

Hardy, North American, herbaceous perennials. Seeds, and division of the plant in spring; a moist, shady peat-border.

- Z. bracteatus*. 1 $\frac{1}{2}$. Cream. May. 1811. Syn., *Helonias bracteata*. B. M. t. 1703.
 — *commutatus*. 1. Cream. June. 1811. Syn., *Helonias glaberrima*. B. M. t. 1680.
 — *elegantis*. 1. White. May. 1828.
 — *Fremontii*. 1. Creamy. California. 1871.
 — *glaberrimus*. 1. Cream. June. 1811.
 — *hybridus*. See *Melanthium hybridum*.
 — *monocus*. 2. Brown. June. 1811.
 — *Nuttalli*. $\frac{1}{2}$ -1. White. June. Texas and California. Gf. t. 1121, fig. 2.
 — *virginicus*. See *Melanthium virginicum*.

Zygoclox. (From *Zygopetalum* and *Colax*, between which genera this is a hybrid. Nat. ord., *Orchideæ*.)

For culture, see ZYGOPETALUM.

- Z. Veitchii*. 1. Greenish-yellow, blotched purplish-brown; lip pale yellow with violet-purple stripes. A hybrid between *Colax jugosus* and *Zygopetalum crinitum*. See G. C. 1887, i. p. 765.

Zygopetalum. (From *zygos*, a yoke, and *petalon*, a petal; the union of the bases of the petals and sepals. Nat. ord., *Orchideæ*; Tribe, *Vandee-Cyrtopodieæ*.)

Stove orchids, grown in pots. See ORCHIDS.

- Z. africanum*. B. M. t. 3812. A synonym of *Odontoglossum bictoniense*.
 — *aromatium*. White, blue. Chiriqui. 1867. Syn., *Warsceviczella aromatica*.
 — *Bachhousiana*. Purplish-violet, cream, sulphur. Ecuador. 1887. Syn., *Pescatorea Bachhousiana*.
 — *Beaumontii*. Creamy-white, purplish-violet, yellow. Brazil. 1850. Syns., *Batemannia Beaumontii* and *Galeottia Beaumontii*.

Z. bellum. Pale violet, yellowish, brown. Columbia. 1878. Syn., *Pescatorea bella*.

— *brachypetalum*. Brown, green, bluish-violet. October. Brazil. 1844.

— *stenopetalum*. Brownish-purple, green, violet, white. 1888. Gf. t. 1277.

— *Burkei*. Green, brown; lip white, crimson. Guiana. 1883. Warn. Orch. Alb. t. 142.

— *caudidum*. $\frac{3}{4}$. White, rosy- and bluish-purple. Bahia. Syns., *Huntleya candida*, *Warrea candida* and *Warsceviczella candida*.

— *cerinum*. 1. Pale straw-colour, yellow. Chiriqui. 1861. Fl. Ser. t. 1815. Syns., *Huntleya cerina*, B. M. t. 5598, and *Pescatorea cerina*.

— *citrinum*. Deep yellow, crimson. Late summer. Brazil. 1838. Syns., *Maxillaria citrina* and *Promenaea citrina*.

— *Claui*. Deep purplish-brown, green, violet-purple. 1876. A hybrid between *Z. crinitum* and *Z. maxillare*. Flor. Mag. new ser. t. 267.

— *cochlear*. White, blue. West Indies. B. M. t. 3585.

— *caeleste*. Pale blue, mauve, yellowish. June. Columbia. 1878. Syn., *Bollea caelestis*. B. M. t. 6458. Greenhouse.

— *Crepeauvii*. Dark red, yellow; lip white, violet. Brazil. 1887.

— *crinito-maxillare*. A garden hybrid. Garden, xxxviii, p. 43.

— *crinitum*. Green, brown; lip white, yellow. November. Brazil. 1829. B. C. t. 1687. Syns., *Z. Mackayi* var. *crinitum*, B. M. t. 3402, and *Z. stenochilum*. B. C. t. 1923.

— *caeruleum*. Veined with bright blue.

— *Dayanum*. White, green, violet. Columbia. 1873. Syn., *Pescatorea Dayana*.

— *candidulum*. White, purplish. Columbia. 1875. Syn., *Pescatorea Dayana*, var. *candidula*.

— *rhodacrum*. Sepals and petals with purplish-rose tips. September. 1874. Syn., *Pescatorea Dayana*, var. *rhodacra*.

— *splendens*. White, chocolate-purple. Columbia. 1875.

— *discolor*. Straw-colour, purple, yellow. Central America. Syns., *Warrea discolor*, B. M. t. 4830, and *Warsceviczella discolor*.

— *Dormannianum*. White, pale sulphur. Columbia? 1881. Syn., *Pescatorea Dormanniana*.

— *euglossum*. Lilac. Ecuador. 1877. Syn., *Pescatorea euglossa*.

— *expansum*. Green, brown. Ecuador? 1878.

— *fimbriatum*. $\frac{3}{4}$. White, purple. Syn., *Pescatorea fimbriata*. Gf. t. 1008.

— *forcipatum*. Whitish-ochre, brick-red, purple. 1888.

— *Gairianum*. Violet, black-purple, rose. 1879. Syn., *Pescatorea Gairiana*.

— *Gautieri*. Green, brown, white, purple. Brazil. 1868.

— *gemma*. White. Columbia. 1874. Syn., *Kefersteinia gemma*.

— *Gibezia*. White, violet. Lind. t. 181.

— *gramineum*. Yellow, brown. November. Popayan. 1844. Syn., *Kefersteinia graminea*. B. M. t. 5046.

— *hemixanthum*. White; lip yellow. New Grenada. Syn., *Bollea hemixantha*.

— *intermedium*. Green, blue, purple. November. Brazil. 1844.

— *Jorisia*. Venezuela. 1890. Lind. t. 237.

— *Klabochorum*. White, chocolate, yellow. Tropical America. 1879. Syn., *Pescatorea Klabochorum*.

- Z. Klabocho'rum burfordensis*. Flower darker. 1879.
- *ornatissimum*. A variety tipped with deep mauve-purple. 1884.
- *la'cteam*. White. Chiriqui. 1872. Syn., *Kefersteinia lactea*.
- *Lali'ndei*. Bright light violet, yellow. Columbia. 1874. Syn., *Bollea Lalindei*. B. M. t. 6331.
- *lamello'sum*. 1. White, yellow, brown. August. Columbia. 1875. Syn., *Pescatorea lamellosa*. B. M. t. 6240.
- *lamina'tum*. Light yellow; lip white; column yellowish with green spots. 1885.
- *Lawrencea'tum*. White, yellow, violet. 1878. Syn., *Bollea Lawrenceana*.
- *Lehma'nni*. 1. White, reddish- and mauve-purple. Ecuador. Syn., *Pescatorea Lehmanni*. Warn. Orch. Alb. t. 57.
- *lentigin'o'sum*. Green, purple. July. Brazil. 1843. Syn., *Promenaea lentiginosa*.
- *leopard'i'num*. Greenish-yellow, brown; lip purplish-mauve, ochre. Garden hybrid. 1886.
- *Linde'nia*. Pale rose, white. Venezuela. Lind. t. 275.
- *lu'cidum*. Light brown, purple, bright green, orange, lilac, white. British Guiana. 1889.
- *Macka'yi*. Yellowish-green, brownish-purple, white, blue. Brazil. 1825. B. M. t. 2748. Syn., *Eulophia Mackaiana*. B. R. 1433. Greenhouse.
- *crini'tum*. See *Z. crinitum*.
- *interme'dium*. A variety with paler coloured flowers.
- *margin'a'tum*. White, crimson. Columbia. Syns., *Warrea quadrata* and *W. marginata*.
- *mazilla're*. Green, chocolate, bluish-purple. September. S. America. 1829. B. M. t. 3686. Greenhouse.
- *Melea'gris*. Pale yellow, purplish-brown, white. June. Brazil. Syns., *Batemanntia Meleagris* and *Huntleya Meleagris*. B. R. 1839, t. 14.
- *al'bidu-fu'l'vum*. Tawny, white, rose, yellowish-green. Brazil. 1868. Syn., *Huntleya albidofulva*.
- *micro'pterum*. White, crimson, purple. Syn., *Promenaea microptera*.
- *Murra'y'num*. Greenish, white, purple, yellow. Organ Mountains. 1837. B. M. t. 3674.
- *mystaci'num*. Yellowish-green, white, purple. Columbia. 1881. Syn., *Kefersteinia mystacina*.
- *obtus'a'tum*. Green, brown, violet.
- *pa'llens*. Pale mauve, greenish-yellow, ochre, brownish-purple. 1881. Syn., *Bollea pallens*.
- *Pati'ni*. Blue, yellow. Columbia. 1874. Syn., *Bollea Patinii*.
- *pentachro'mum*. Green, dark brown; lip white, mauve. Hybrid between *Z. Mackayi* and *Z. maxillare*. 1885. Greenhouse.
- *pi'ctum*. Straw-colour, yellowish-white, purple, greenish. 1883. Syn., *Warscewiczella picta*.
- *Rivie'ri*. Green, brown, white, lilac. Brazil. 1873.
- *Roe'zlii*. White, violet. Ecuador. 1874. Syn., *Pescalorea Roezlii*.
- *Rolliso'ni*. Pale yellow, whitish. Autumn. Brazil. 1838. Syns., *Maxillaria Rollisoni*, B. R. 1838, t. 40, and *Promenaea Rollissoni*.
- *rostra'tum*. Whitish, green, brownish-purple. September. Guiana. 1827. B. M. t. 2319. Syn., *Zyosepalum rostratum*.
- *Ruckeria'num*. White, purple, green, yellow. 1885.
- Z. Russehia'num*. Purplish-rose. Tropical America. 1878. Syn., *Pescatorea Russehiana*.
- *Sanderia'num*. Green, brown, bluish-purple. 1883. Gf. t. 1237.
- *sanguinol'e'ntum*. Pale straw-colour or greenish, blood-red, dark purple. Caracas. Syn., *Kefersteinia sanguinolenta*.
- *Sede'ni*. Purplish-brown, green, bluish-purple. Hybrid between *Z. Mackayi* and *Z. maxillare*. 1874.
- *stapehoi'des*. Greenish-yellow, dark purple. Summer. Brazil. 1843. Syns., *Maxillaria stapehoioides*, B. M. t. 3877, and *Promenaea stapehoioides*. There are two varieties—*nigra* and *rubra*.
- *stenoch'i'lum*. See *Z. citrinum*.
- *tri'color*. A synonym of *Aganisia tricolor*.
- *triu'mphans*. White, blue-black. New Grenada. Syn., *Pescatorea triumphans*.
- *Veit'chii*. See *Zygodolax Veitchii*.
- *vela'ta*. Cream, purple. New Grenada. 1866. Syn., *Warscewiczella velata*.
- *veluti'num*. See *Z. intermedium*.
- *violaceum*. Rich violet, greenish-yellow, white. British Guiana. 1835. Syns., *Bollea violacea*, *Huntleya sessiliflora*, and *H. violacea*.
- *Wailesia'num*. White or cream, violet. Autumn. Brazil. Syns., *Warrea Wailesiana* and *Warscewiczella Wailesiana*. Fragrant.
- *Walli'sii*. White, purple. Central America. 1869. Syns., *Pescatorea Wallisii*, Fl. Ser. t. 1828, and *Batemanntia Wallisii*.
- *ma'jor*. A variety with flowers exceeding five inches in diameter. Costa Rica. 1888.
- *Wendla'ndii*. White, violet-purple. August. Costa Rica. Gf. t. 1267. Syn., *Warscewiczella Wendlandii*.
- *dis'color*. Yellowish-green, white, violet. Costa Rica. Syn., *Warscewiczella Wendlandii*, var. *discolor*. Warn. Orch. Alb. t. 126.
- *Whit'tei*. Creamy-white, yellow. New Grenada. 1890.
- *xanthi'num*. Yellow. Brazil. 1843. Syns., *Maxillaria xanthina* and *Promenaea xanthina*.

Zygophyllum. Bean-caper. (From *zygos*, a yoke, and *phyllo*n, a leaf; leaves in pairs. Nat. ord., *Zygophyllaceae*.)

- Greenhouse, yellow-flowered evergreens, and from South Africa, where not otherwise mentioned. Annual, seeds in a hotbed in spring, and then the plants hardened off, and placed in the open border. Perennials, by cuttings of half-ripened shoots in sand, under a bell-glass, in heat; sandy peat and fibry loam, with a little charcoal and freestone.
- Z. a'lbum*. 2. White. October. Canaries. 1779. Sibth. Fl. Gr. t. 371.
- *atripl'icoi'des*. America. 1837. Hardy herbaceous.
- *cocci'nevum*. 3. Scarlet. Egypt. 1823.
- *cordifo'l'ium*. 6. October. 1774.
- *fo'e'tidum*. 4. June. 1790.
- *insua've*. 4. July. 1790. B. M. t. 372.
- *macula'tum*. 4. October. 1782.
- *ma'jor*. 4. July. Syria. 1596. Hardy herbaceous.
- *microphy'llum*. $\frac{1}{2}$. July. 1816.
- *Morgsa'na*. 3. August. 1732.
- *prostra'tum*. $\frac{1}{2}$. July. 1810.
- *sessilifo'l'ium*. 3. July. 1713. B. M. t. 2184.
- *si'mplex*. $\frac{1}{2}$. July. St. Jago. 1825. Annual.
- *spathula'tum*. June. Cape Verd Islands. 1824. Stove herbaceous.
- *spino'sum*. 1. July. 1837.

Zygo'se'palum. (From *zygos*, a yoke, and *sepalon*, a sepal; the sepals are united. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Cyrtopodiææ*.) See **Zygope'talum.**

Z. rostra'tum. See *Zygopetalum rostratum.*

Zygosta'tes. (From *zygos*, a yoke, and *statos*, standing; in allusion to the

two processes which stand out horizontally from the base of the column, and together somewhat resemble a yoke. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*.)

Stove epiphyte. Should be grown upon blocks. See ORCHIDS.

Z. Greenia'na. White, green. Brazil. 1869.
— *tuna'ta.* Brazil. 1837.

APPENDIX.

ABU

Abu'tilon.

- A. molle*. 10-20. Pinkish-orange. Peru. Syn., *Sida mollis*. B. M. t. 2759.
— *picatum*. Yellow veined with red. Uruguay. Syn., *Sida picta*. B. M. t. 3840.

Aca'mpe.

- A. madagascariensis*. White; lip rose-purple. Madagascar. 1891.

Acantholi'mon.

- A. androsa'ceum*. $\frac{1}{2}$. Red. July. Southern Europe. 1813. Syn., *Statice echinus*. Sibth. Fl. Gr. t. 300.

A'cer.

- A. palma'tum* *Ac'cii*. A garden variety with variegated leaves. 1892. Gil. t. 1363.
— *Trantvette'ri erythroca'rpum*. A variety with red fruit. Caucasus. 1892.

Acera'nthus. (From *acer*, hard or sharp, and *anthos*, flower. Nat. ord., *Berberideæ*.)

Hardy herbaceous perennial. For culture, see EPIMEDIUM.

- A. diphy'llus*. $\frac{3}{4}$. Red. May. Japan. 1830. Syn., *Epimedium diphyllum*. B. M. t. 3443.

Achi'menes.

- A. Schee'rii*. $\frac{3}{4}$. Purple. August. Mexico. 1850. Syn., *Scheeria mexicana*. There is a variety with light blue flowers.

A'chras. (From *achras*, a kind of wild pear. Nat. ord., *Sapotaceæ*.)

A stove evergreen tree with milky juice. Cuttings.

- A. Sapo'ta*. 50. Whitish. May. West Indies. 1731. B. M. t. 311-312. Syn., *Sapota Achras*.

Acio'tis.

- A. fra'gilis*. $\frac{3}{4}$. White. June. Trinidad. 1822. Syn., *Spennera fragilis*.
— *paludo'sa*. $\frac{3}{4}$. Rose. June. Brazil. 1825. Syn., *Spennera paludosa*.
— *pendulo'folia*. $\frac{3}{4}$. Rose. March. Guiana. 1826. Syn., *Spennera pendulifolia*.

Aconi'tum.

- A. Fische'ri*. Blue. N. E. Asia and N. America. 1890. B. M. t. 7130. Syn., *A. californicum*.

Actæ'a.

- A. palma'ta*. A synonym of *Trantvetteria palmata*.

ÆSC

Actine'lla.

- A. lana'ta* is a synonym of *Eriophyllum cæspitosum*, not *Eriospermum cæspitosum*, as stated on page 13.
— *scapo'sa*. 1. Yellow. Texas.

A'da.

- A. Lehma'nni*. Orange; lip white, yellow. Columbia. 1891.

Adeno'sma. (From *aden*, a gland, and *osme*, smell; the plants are furnished with glands exhaling a mint-like odour. Nat. ord., *Scrophulariaceæ*. Syn., *Pterostigma*.)

Stove herbaceous perennial. Cuttings. Sandy peat.

- A. grandiflorum*. 3. Violet. Hongkong. 1845. Syn., *Pterostigma grandiflorum*. B. R. 1846, t. 16.

Adia'ntum.

- A. eleganti'ssimum*. A sport from *A. cuneatum*. G. C. 1892, xii. p. 249. Stove.
— *Lambertia'num*. A variety of *A. cuneatum*. 1890.
— *macrophy'llum albostria'tum*. Fronds streaked with creamy-white. 1892.
— *manica'tum*. A seedling. 1890. Gard. xxxviii. p. 94.

Æ'chmea.

- Æ. Furstenbergii*. A synonym of *Streptocalyx Furstenbergii*.
— *tillandsioi'des*. A synonym of *Portea tillandsioides*.

Aera'nthus.

- A. brachyce'ntrom*. 1. Pale yellow. Comoro Islands? 1890.

Ae'rides.

- A. augustia'num*. Rose. Philippine Islands. 1890. Lind. t. 210.
— *Janso'ni*. A natural hybrid between *A. odoratum* and *A. expansum*. Burmah. G. C. 1890, viii. p. 66.
— *Lavre'nceæ Amesia'na*. A richly-coloured variety. 1891.
— *maculo'sum*. A synonym of *Saccolabium speciosum*.
— *Savagea'num*. White, crimson-purple. 1891.
— *suav'issimum bla'ndum*. An unspotted variety. 1891.

Æschyno'mene.

- A. arista'ta*. A synonym of *Pictetia aristata*.

Æ'sculus. PAVIA is sometimes united with this genus, from which it

differs in having smooth, not spiny, fruits.

Agape'tes.

- A. macrantha*. White, yellow, red. December. Moulmein. 1849. Syn., *Thibaudia macrantha*. B. M. t. 4566.
 — *Ma'nini*. Flowers inconspicuous. Khasia. 1892.
 — *pulcherrima*. Red, green. May. India. 1845. Syn., *Thibaudia pulcherrima*. B. M. t. 4363.
 — *variegata*. Scarlet. Khasia. 1837. Syn., *Thibaudia variegata*.

Agari'sta.

- A. nerifolia*. 3. Crimson. June. Brazil. 1851. Syns., *Andromeda nerifolia* and *Leucothoe nerifolia*, B. M. t. 4593.
 — *pulchra*. 2. Greenish-white. Caraccas. Syn., *Leucothoe pulchra*. B. M. t. 4314.

A'gave.

- A. Franzosi'ni*. 40. Green, yellow. 1892. G. C. 1892, xii. p. 179, fig. 31.

Agera'tum.

- A. latifolium*. A synonym of *Piqueria latifolia*

Aglaeone'ma.

- A. costa'tum*. Leaves green, spotted and veined with white. Spathe green. Perak. 1892.

Agonis. (From *agon*, a gathering; there are numerous seeds. Nat. ord., *Myrtaceæ*.)

Greenhouse evergreen shrubs, or small trees.

- A. flexuosa*. 40. White. Summer. West Australia.
 — *marginata*. White. Summer. West Australia. 1827. Syn., *Fabricia stricta*. B. C. t. 1219.

Aizo'on.

- A. canarie'nse*. Andr. Rep. t. 201. A synonym of *Sesuvium Portulacastrum*.

Alber'ta. (In honour of *Albertus Magnus*, a philosopher and theologian of the thirteenth century. Nat. ord., *Rubiaceæ*.)

Ornamental greenhouse or stove shrub.

- A. ma'gna*. Red. Fruit red, winged. Natal. 1891.

Albu'ca.

- A. Buchana'ni*. Yellow. Nyassa-land. 1892.

Alka'anna. (From the Arabic name, *alkanna*. Nat. ord., *Boraginææ*; Tribe, *Boragææ*.)

Hardy herbs. For culture, see LITHOSPERMUM.

- A. orienta'tis*. 2. Yellow. June. Levant. 1713. Syn., *Lithospermum orientale*, B. M. t. 515.
 — *tinctoria*. 1½. Blue. July. South Europe. 1596. Syn., *Lithospermum tinctorium*, Andr. Rep. t. 576.

Allama'nda.

- A. Willia'msii*. An erect variety of *A. cathartica*. Journ. of Hort. 1891, xxiii. fig. 14.

Allople'ctus.

- A. Ly'ndei*. Stem purplish. Yellow; calyx reddish. New Grenada? 1892. B. M. t. 7271.
 — *tigrina*. The correct name for the plant described on p. 469 as *Heintzia tigrina*.

Aloca'sia.

- A. conspicua*. A hybrid between *A. odora* and *A. Putzeyssi*. 1891.
 — *Dussii*. Leaves olive-green veined with brownish-red. 1892.
 — *Mortfontane'nsis*. A hybrid between *A. Lowii* and *A. Sanderiana*. 1891.
 — *Rodriga'na*. A hybrid between *A. Thibauti* and *A. Reginae*. 1891.

A'loe.

- A. auranti'aca*. Yellow, tinged with red. South Africa. 1892.

Al'o'na.

- A. rostra'ta*. A synonym of *Osteocarpus rostratus*.

Alo'phia. (From *a*, not, and *lophos*, a crest. Nat. ord., *Irdeææ*; Tribe, *Moræææ*.) A synonym of *Herbertia*.

- A. Drummondii*. See *Herbertia Drummondiana*.

Alterna'nthera.

- A. flavescens*. 1. White. July. S. America. 1824. Syn., *Iresine flavescens*.

Aly'ssum.

- A. canescens*. White. April. Siberia. 1828. Syns., *Ptilotrichum canescens* and *P. elongatum*.
 — *podolicum*. ½. Yellow. June. Podalia. 1821. Syn., *Schivereckia podolica*, B. C. t. 1720.

Amara'lia.

- A. dignoni'castra*. 3. White, red. June. Sierra Leone. 1842. Syns., *Gardenia Sherburniææ*, B. M. t. 4044, and *Sherburniææ fotosa*.

Ama'ryllis.

- A. citri'na*. A synonym of *Sternbergia colchiciflora*.
 — *lutea*. A synonym of *Sternbergia lutea*.

Amorphopha'llus.

- A. Lacou'rii*. A synonym of *Pseudodracontium Lacou'rii*.
 — *zeylanicus*. A synonym of *Synantheriasylvatica*, B. M. t. 7190.

Ampelovi'tis.

- A. interme'dia*. A vine with the stem and leaf-stalks covered with stout bristles. 1891.
 — *Romane'ti*. Leaves lobed. Grapes black. China? 1892.

Ampho'dus.

- A. ova'tus*. B. R. t. 1101. A synonym of *Kennedyia rubicunda*.

Anaca'mpseros.

- A. Telephia'strum*. ½. Reddish. July. South Africa. 1813. Syn., *Talinum Anacamperos*.

Andro'meda.

- A. nerifolia*. See *Agarista nerifolia*.
 — *speciosa*. B. C. t. 551. A synonym of *Zenobia speciosa*, not of *Pieris speciosa*, as stated on p. 41.

Androsa'ce.

- A. alba'na*. Pinkish. April and July. E. Caucasus. 1892.
 — *caucasica*. Bright pink. Summer. Caucasus. 1892.
 — *cyli'ndrica*. Pure white. 1890.

Anemone.

- A. caffra*. 1. White. S. Africa. 1890. Green-house.
— *thalictroides*. B. M. t. 866. A synonym of *Thalictrum anemonoides*.

Angræcum.

- A. fra'grans*. White. Bourbon and Mauritius. 1891. B. M. t. 7161. The dried leaves are used as tea in Bourbon.
— *Obrienia'num*. Greenish-white. G. C. 1892, xi. p. 816.

Angulo'a.

- A. unijlo'ra* *Treyera'ni*. Base of lip with numerous rosy bars. Andes. 1892. Lind. t. 310.

Ano'da.

- A. puni'cea*. Red. Mexico? Syn., *Sida periptera*, B. M. t. 1644.

Anse'lia.

- A. hu'milis*. Lemon-yellow, marked with chocolate. Zambesi. 1891.
— — *pa'ulida*. A variety with the ground-colour milk-white. 1891.

Anthe'phora.

- A. e'legans*. A synonym of *Tripsacum hermaphroditum*.

Anthurium.

- A. Andrea'num* *Wambeke'a'num*. Spathes white. 1892. Ill. Hort. new ser. t. 163.
— *angusta'tum*. 1. May. Trinidad. 1823. Syn., *Pothos angustata*.
— *ebu'rneum*. Hybrid between *A. Andreanum* and *A. ornatum*. 1891.
— *Greya'num*. Hybrid between *A. ornatum* and *A. Andreanum*. 1892.
— *Lavre'nciæ*. Garden hybrid. 1892.
— *Paradi'sæ*. Hybrid between *A. Andreanum* and *A. ornatum*. 1891.
— *Ridolfia'num*. Spathe white; spadix pink. 1821.
— *rotundisp'a'thum*. Hybrid between *A. Andreanum* and *A. Lindeni*. 1891. Ill. Hort. new ser. t. 119.
— *rubrine'rium*. 2. South America. 1820. Syn., *Pothos rubrinervia*.

Aphelia'ndra.

- A. Blanchetia'na*. Leaves deep green, with silvery veins. Brazil. 1888. B. M. t. 7179. Syn., *A. ama'ena*.
— *Hydrom'e'stus*. 2. Yellow. May. Mexico. 1842. Syns., *Hydromestus maculatus* and *Strobilora'chis glabra*.
— *longisca'pa*. A synonym of *Thysacanthus Lemaireanus*.
— *tetra'gona imperia'lis*. Scarlet. Central America. 1891. Gfl. t. 1354.

Aphlo'ia.

- A. mauritia'na*. 4. Yellow. July. Mauritius. 1823. Syn., *Ludia heterophylla*.

Apodol'ion. (Nat. ord., *Amaryl-lidæ*.)

- A. lanceola'tum*. 8. White. July. S. Africa. 1794. Syn., *Gethyllis lanceolata*.

Appendi'cula. (Nat. ord., *Orchidæ*.)

- A. Peyeria'na*. White. Sumatra. G. C. 1891, x. p. 669.

Apricot. *Armeni'aca vulga'ris*.

- Varieties*.—1. *Early Masculine*.—End of July. The best of the very early

Apricots. Fruit rather small, round, and of a yellowish colour, tinted with red on one side.

2. *Large Early*, or *Précocé*.—Ripens next in order. An oblong fruit of a palish-orange colour, with a very agreeable juice.

3. *Blenheim*, or *Shipley's*.—One of the most useful Apricots in the kingdom; for, although inferior in flavour to the Moorpark, it is a much greater bearer, and a sure ripener. An oval fruit, middle-sized, and of a palish lemon colour. This kind is allied to the Moorpark; possibly a seedling from it.

4. *Hemskirke*.—Another of the Moorpark section; somewhat earlier. This also ripens safer than the Moorpark, which is a weighty consideration with Northern horticulturists. A roundish fruit, somewhat flattened at the crown; colour, orange and red.

5. *Breda*.—A well-known preserving fruit, and most eligible for growing as an ordinary standard in our southern counties, or on any trellis device. Called "*Brussels*" by some. A small fruit, generally of a cramped or angled appearance; of an orange colour, and rich flavoured.

6. *Royal*.—A good fruit, of very rich flavour, ripening just a little before the Moorpark. Of a large size, oval, and of an orange complexion.

7. *Moorpark*.—The first Apricot in the kingdom, taken altogether, a full-sized roundish fruit, ripening about the middle of the season; flavour first rate. No garden of any pretensions is complete without a Moorpark or two.

These are all that are truly essential to the amateur or the cottager. For the amateur who, in a small garden, has room for three only, and those distinct kinds, we recommend Nos. 3, 5, and 7. If four, then take Nos. 1, 3, 5, 7. If five, then Nos. 1, 3, 5, 6, 7. For cottagers, we say Nos. 3 and 7. Above all, we would recommend the "*Shipley's*" to the cottager, as being a hardier and larger tree, and a much surer bearer. Besides the above, there are the *Black*, the large early *Musch-Musch*, very sweet, of the Breda section; the *Orange*, fitter for preserving than dessert, a good bearer; the *Roman*, another good bearer; the *Turkey*, a useful late variety; the *Haisha*, a Syrian kind, delicious, and possessing a sweet kernel.

Choice of Trees.—Those who have to select, whether from stock of their own, or from the nursery, should first see that the junction between the stock and the scion is complete, and thoroughly healed.

If any gum or other exudation appear on any stem, by all means reject the tree as to present use.

Two or three years' trained trees are the most eligible, and such should possess at least two branches on either side, and a central one if possible. Care should be taken to select those in which the side-branches are of about equal thickness.

Propagation is best done by budding. Some choose the Apricot stock, or those from the kernels; others prefer the plum stock; the latter, however, has been much complained of in late years. Our nurserymen have what is called a "commoner" stock, which appears to be a sort of wild plum, and which, in general, answers pretty well.

For dwarfs, bud at eight inches from the soil; for half standards, at three feet; and for standards, at five feet.

Period of Planting.—Those who wish to gain time may plant successfully in the first or second week of October: any time, however, from that period until the early part of March will do.

Soil.—A good, sound, and rather unctuous loam is best, using a little ordinary vegetable matter, but no manure, unless on the surface. See **Mulching**. Do not make the soil deeper than eighteen inches. See article **Stations**.

Aspect.—A south aspect is best in the northern parts of the kingdom; but the east and west frequently produce superior fruit in the southern counties, where very warm aspects are apt to produce mealy fruit in hot seasons. Standards can only be grown in our southern districts, where they are sometimes very prolific and high-flavoured. As standards, they are several years in coming into bearing.

Training.—The branches should be on an average from six to eight inches apart,

and kept as horizontal as possible. The following is a very good form; but the ordinary fan-training is very well

adapted, if care be taken to pinch over-luxuriant shoots in time.

Pruning must be regulated by the knowledge that, with the exception of such as the Moorpark, many varieties bear chiefly on the shoots of the previous year; the Moorpark mostly on spurs two and three years old.

Summer Pruning.—Take off all fore-right shoots, and others that are irregular and misplaced, reserving those that are not too vigorous, and that will train in well for next year's bearing. If done early in May, the finger and thumb will supersede the necessity for the knife. Continue to nail the shoots to the wall, as necessary, during the summer, tying down or nailing in all short-jointed, weak-looking sprays. Over vigorous shoots may be stopped early in June, and be thus induced to put forth more fertile laterals.

Winter Pruning had best be done as soon as the leaves have fallen, though it may be carried on till the buds begin to swell in March. Cut out any naked-looking shoots not more than four or five years old, avoiding amputation in the larger limbs, and get their places re-occupied by younger and better branches. Keep a leading shoot at the end of each branch. Vigorous shoots of the last year shorten, as far as the points seem ill-ripened, weaker shoots about one third. This promotes the production of laterals for next year's fruiting, and gives a fuller supply of sap to the blossom-buds. Cut off gross, fore-right spurs; but lateral spurs may be retained, as they sometimes produce blossom-buds, as they nearly always do in the Moorpark. Let, also, all decaying or imperfect points be pruned off.

Espaliers are to be formed as those on walls; standards only requiring dead, crowded, or chafing branches to be removed.

When an Apricot gets diseased it is much more profitable to replace it by a younger tree than to attempt its renovation.

Gathering should not take place before the fruit is dead ripe, or it will be mealy.

Thinning should commence as soon as the fruit is large enough for tarts, in May, or early in June; no fruit being left nearer finally than about five inches to another. The thinning may be done, however, twice.

Insects.—Wasps and flies are best kept off by a net, at least a foot from the wall. See **Earwig**, **Pædisia**, and **Aphis**.

Mildew is often the most formidable:

assailant of the Apricot, as it usually arises from excess of moisture to the root. Draining the border, and mixing lime with the soil, has, in such cases, been found efficacious as a preventive; and, at the same time, sulphur, as a well-known and powerful antagonist of the mildew, may be carefully dusted over the tree.

Protection of Blossom.—We know of no fruit that more requires or deserves the fostering care of the gardener than this. Blossoming, as it frequently does, at the end of February or beginning of March, it must expect to be rocked by not only the "rude, imperious gale," but, what is much more, to be subjected occasionally to a temperature of some ten or fifteen degrees of frost. We have always found it the best policy to protect carefully, using a rather thick covering, and taking care to remove it on every possible occasion. Nothing can be better than a stout canvas. Some, however, use bunting; some, ordinary garden-mats; and not a few, the fronds of ferns, spruce-branches, and even wisps of straw.

General maxims of culture.—First of all, a sound, loamy soil, with very little manure, is most suitable. It is well, nevertheless, in order to gain time, to use a little generous soil, to start the plant into free growth; secondly, to persist in summer stopping, in order to equalize growths; and thirdly, after careful summer training, to remove all superfluous sprays which shade the embryo fruit buds in the end of August. In addition to this, top-dressings in May, and the application of liquid manure, when the fruit commences the last swelling, will be found useful adjuncts of high culture. Apricot branches, especially the Moorpark, are apt to decay of a sudden, without apparent reasons. By persisting in the tying-down system, however, a succession is ever ready for any gap.

Apto'simum.

A. depræsum. B. R. t. 1882. A synonym of *Ohlendorffia procumbens*.

Aquilegia.

A. transilvanica. A synonym of *A. glandulosa*.

A'rabis.

- — *bogote'nsis*. Crimson, black, green. Columbia. 1872.

- *Bredemeyera'na*. See *B. multiflora*.

- *Caldasiana*. Orange-yellow, with crimson spots. Andes of Peru. 1863. Syn., *Alströmeria Caldasii*. B. M. t. 5442.

- *Carde'ri*. Rose, purple-brown. November. Columbia. 1876. Flor. Mag. new ser. t. 239.

- *chontale'nsis*. See *B. edulis*, var. *chontalensis*.

- *conferta*. See *B. patacoensis*.

- *densiflora*. See *B. tomentosa*.

- *edulis*. 6. Pink, green, claret-brown. July. Tropical America. 1820. Syns., *Alströmeria edulis*, Andr. Rep. t. 649, and *A. Salsilla*, B. M. t. 1613.

- — *chontale'nsis*. Rose, yellow, brown. August. Nicaragua. 1871. Syn., *B. chontalensis*, B. M. t. 5927.

- — *ovata*. Red, green. Chili. 1824. Syns., *B. hirtella*, *B. ovata*, and *Alströmeria ovata*, B. M. t. 2846.

- *frondea*. Reddish-brown, bright yellow. New Grenada. 1832.

- *hirtella*. See *B. edulis*, var. *ovata*.

- *Falbreyeri*. Reddish-brown, bright yellow with claret-brown spots. New Grenada. 1833.

- *multiflora*. Orange, brown. September. New Grenada. 1829. Syns., *B. Bredemeyeriana*, Fl. Ser. t. 2316, and *B. acutifolia*, var. *punctata*.

- *oligantha*. Reddish, yellow, claret. Peru. 1877.

- *ovata*. See *B. edulis*, var. *ovata*.

- *patacoe'nsis*. Bright red, yellow. October. Andes of Ecuador and New Grenada. 1882. B. M. t. 6692. Syn., *B. conferta*.

- *pubibu'nda*. Pink. N. S. Wales. 1856.

- A. ro'sea*. Pale red, greenish-yellow. Andes of S. America. Syn., *E. simplex*. B. M. t. 3863.
- *Salsilla*. Mauve-purple. June. Chili. Syn., *Alströméria Salsilla* of Linnæus and *A. oculata*, B. C. t. 1851. *A. Salsilla* of B. M. t. 1613 is *B. edulis*.
- *Shuttleworthii*. Reddish, yellow, green, reddish-brown. Andes of New Grenada. 1882.
- *simplex*. See *B. rosea*.
- *sororia*. Rose spotted with carmine, green spotted with brown. S. America. 1892. Ill. Hort. new ser. t. 145.
- *tomentosa*. Yellow, red. Andes of S. Amer. 1865. Syn., *B. densiflora*, B. M. t. 5531.
- *vitellina*. Bright yellow. New Grenada. 1882.
- *Willia mista*. Pink, white, spotted with dark purple, greenish. New Grenada. 1882.

Bottinæ'a.

- B. thysanotoides*. 1. White. March. Chili. 1829. B. M. t. 3084. Syn., *Anthericum plumosum*.

Boucerosia.

- B. incarnata*. 1. Flesh-colour. June. South Africa. 1793. Syn., *Piaranthus incarnatus*.
- *mammillaris*. Brown, June. South Africa. 1774. Syn., *Piaranthus mammillaris*.

Boureria.

- B. divaricata*. 15. Havana. 1820. Syn., *Ehretia divaricata*.
- *laxa*. White. Madagascar. Syn., *Ehretia laxa*. Jacq. H. Schoenh. t. 41.

Boutelo'ua.

- B. racemosus*. 3. August. S. Europe. 1768. Syn., *Atheropogon aphioides*.

Brachycarpæ'a.

- B. varians*. 6. Purple. July. South Africa. 1713. Syn., *Polygala bracteolata*.

Brachychiton.

- B. Bidwillii* is a synonym of *Sterculia Bidwillii*.
- *diversifolium* is a synonym of *Sterculia diversifolia*.

Brachylæ'na.

- B. elliptica*. 8. Purple. South Africa. 1816. Syn., *Tarconanthus ellipticus*.
- *neriifolia*. Yellow. August. South Africa. 1752. Syn., *Tarconanthus dentatus*.

Brachylo'ma.

- B. ciliatum*. 3. White. June. Australia. 1825. Syn., *Lissanthe ciliata*.
- *daphnoides*. 3. White. June. Australia. 1818. Syn., *Lissanthe daphnoides*, B. C. t. 466, and *L. stellata*.

Brachyse'pha.

- B. undulata*. 1. White. February. South Africa. 1790. Syn., *Lachenalia pusilla*, Jacq. Ic. t. 585, *Massonia scabra* and *M. undulata*.

Brachyste'phium.

- B. leucanthemoides*. 1. White. July. Australia. 1823. Syn., *Pyrethrum diversifolium*. B. R. t. 1025.

Brassa'vola.

- B. Digbyana* is now known as *Lælia Digbyana*.
- *glauca* is now known as *Lælia glauca*.

Brassica. SINA'PIS is now a synonym of this genus.

Bra'ya.

- B. purpurascens*. 1. Purplish. May. Melville Island. 1827. Syn., *Platypetalum purpurascens*.

Bro'wnea.

- B. Crawfordii*. A hybrid between *B. grandiceps* and *B. macrophylla*.
- *erecta* and *princeps* are synonyms of *Tatisia princeps*.

Buckle'ya. (Nat. ord., *Santalaceæ*.)

- B. distichophylla*. 10. Greenish. North Amer. 1890. Gard. and For. iii. p. 237, fig. 37.

Buddle'ia.

- B. Colvilei*. Rose. Himalayas. G. C. 1892, xii, p. 186, fig. 32.

Bulbophyllum.

- B. a'nceps*. Yellowish, purple, white. Borneo. 1892. Lind. t. 351.
- *comosum*. White. Burmah. 1822.
- *denticulatum*. Yellowish. Sierra Leone. 1891.
- *elegans*. Rosy-purple. Ceylon. 1892.
- *fallax*. 1. Dark purple. Assam. 1859.
- *inflatum*. Greenish-yellow. Sierra Leone. 1891.
- *lemniscatoïdes*. Purple, green. Java. 1890.
- *nigripetalum*. Yellowish, purplish-black. West Tropical Africa. 1891.
- *Obrienianum*. Yellow with dark reddish-purple spots. Himalayas. 1892.
- *suavisimum*. Pale yellow. Upper Burmah. 1889.

C.

Ca'cabus.

- C. prostratus*. Blue. Peru. Syn., *Physalis prostrata*. Andr. Rep. t. 75.

Caccinia. (After Signor Caccini, an Italian. Nat. ord., *Compositæ*.)

- C. glauca*. Blue. Persia. 1883.

Ca'ctus.

- C. myriostigma* is now referred to *Astrophytum myriostigma*.

Calade'nia. Syn., *Leptoceras*.

- C. fimbriata*. Yellow. May. West Australia. Syn., *Leptoceras fimbriata* and *L. pectinata*.
- *Menziesii*. Yellow. May. West Australia. Syn., *Leptoceras oblonga*.

Cala'dium.

- C. adamantium*. Leaves dark green, veined and dotted with white. Peru. 1891. Ill. Hort. new ser. t. 132.
- *medioradiatum*. Leaves dark green; midrib and its two chief branches silvery-white. Columbia. 1891. Ill. Hort. new ser. t. 128.
- *sagittatum*. Leaves dark green, midrib feathered with red. Brazil. 1891. Ill. Hort. new ser. t. 138.

Calampe'lis.

- C. scabra ro'sea* is a variety of *Eccremocarpus scaber* with orange-red flowers. 1891.

Calandri'nia.

- C. polyandra*. Purple. August. Australia. 1853. Syn., *Talinum polyandrum*. B. M. t. 4833.

Cala'nthe.

- C. Eyerma'nii*. A hybrid between *C. vestita* and *C. Veitchii*. 1891.
 — *labro'sa*. Yellowish-brown, purple. Moulmein. 1879. Syn., *Limatodes labrosa*.
 — *Myle'sii*. White; lip white, tinged with lemon in the throat. A hybrid. 1890. Warn. Orch. Alb. t. 402.
 — *Sanderia'na*. 2. Lilac; lip darker. E. Tropical Africa. 1892.
 — *vesti'ta Fournie'rii*. A small-flowered variety. Borneo. 1892.
 — *viridi-fu'sca*. A synonym of *Tainia latifolia*.

Ca'lla.

- C. Pentla'ndi*. See *Richardia Pentlandi*.

Calliste'mon.

- C. macrosta'chyum*. A synonym of *Kunzea Baisteri*.

Calocho'rtus.

- C. amo'e'nus*. Deep rosy-pink or purple. July. 1892.
 — *Kenne'dyi*. Bright scarlet, black. July. California. 1892. B. M. t. 7264.

Calosa'nthes.

- C. i'ndica*. The correct name of this is *Orozylum indicum*.

Calotha'mnus.

- C. sangui'neus*. Red. May. Swan River. Syn., *Conothamnus eriocarpus*.

Calpu'rnia.

- C. robinio'des*. S. Africa. Syn., *Robinia capensis*.

Calyco'pteris.

- C. floribu'nda*. 6. Yellow, green. India. 1815. Syn., *Getonia floribunda*.
 — *nu'tans*. 6. India. 1816. Syn., *Getonia nutans*.

Calydo'rea.

- C. specio'sa*. 1. Blue. June. Chili. 1836. Syn., *Sisyrinchium speciosum*. B. M. t. 3544.

Campa'nea.

- C. Humbol'dtii*. 3. Green, purple. Central America. 1853. Syn., *Rhytidophyllum Humboldtii*.
 — *Oerste'dtii*. 2. Green, purple. Central Amer. 1852. Syn., *Rhytidophyllum Oerstedii*.

Campa'nula.

- C. exco'sa*. July. Switzerland. 1891.
 — *sin'e'nsis*. 3. Blue. China. 1846. Syn., *Platycodon sinensis*. Lem. Jard. Fl. t. 250.
 — *Spe'culum*. See *Prismatocarpus Speculum*.
 — *Wanne'ri*. See *Symphyanthra Wanneri*.

Cansco'ra. Syn., *Pladera*.

- C. Pari'shii*. 2. White. Moulmein. 1864. B. M. t. 5429.

Caragua'ta.

- C. Belea'na*. 2. White. Rev. Hort. 1891, p. 114, fig. 27.

Carallu'ma.

- C. campanula'ta*. Brownish-purple. Ceylon. 1892. B. M. t. 7274.

Ca'rex.

- C. gra'cilis*. Japan, India and Australia. 1892.

Carludo'vica.

- C. micropeta'la*. Pale yellow. Costa Rica. 1892. B. M. t. 7263.

Catakidoza'mia.

- C. Maelsa'yi*. A synonym of *Macrozamia Perouskiana*.

Catase'tum.

- C. Leichtenstei'nii*. Green, brown. 1892.

Ca'ttleya.

- C. Aleza'ndrae*. Dull brown; lip rosy-purple. Brazil. 1892.
 — *Ame'sia*. Garden hybrid. 1891.
 — *amo'na*. Garden hybrid. Orch. 1891, p. 273.
 — *au'rea Statteria'na*. Syn., *C. Statteriana*. 1892.
 — *Batali'nii*. Rosy-purple, whitish, deep rose. Brazil. 1892.
 — *Blese'nsis*. Garden hybrid. 1892.
 — *Burberry'na*. Garden hybrid. 1892.
 — *cri'spa delicatissi'ma*. White, mauve-purple. S. Brazil. 1891. Warn. Orch. Alb. t. 424.
 — *Gaskellia'na specio'sa*. White, rose-purple. 1891.
 — *grandiflo'ra*. A synonym of *Sophronitis grandiflora*.
 — *Hardya'na Gardenia'na*. Rose, yellow, magenta-purple. 1892. Lind. t. 363.
 — *Laversine'nsis*. Rosy-purple. 1891.
 — *interme'dia punctati'ssima*. Pale rose, deep purple. S. Brazil. 1891. Rech. ser. 2, t. 24.
 — *labia'ta marmora'ta*. A mottled variety, known in some gardens as *C. Wanneri*. 1892.
 — *Sande'rae*. Whitish, deep crimson. 1892.
 — *leucoglo'ssa*. Garden hybrid. 1892.
 — *Lourya'na*. A supposed hybrid. 1891.
 — *Mina'cia*. Garden hybrid. 1892.
 — *Mo'ssae'de'cora*. A form with lip yellowish veined with magenta-purple. La Guayra. 1891. Warn. Orch. Alb. t. 421.
 — *Owenia'na*. Creamy-white, crimson, gold. 1892.
 — *Parthe'nia*. Garden hybrid. 1891. Lind. t. 276.
 — *Philo* and var. *albiflo'ra*. Garden hybrids. 1892.
 — *princeps*. A variety of *C. Schofieldiana*. 1892.
 — *Schro'deria'na Leyswoode'nsis*. White, orange. 1892.
 — *speciosi'ssima Sanderia'na*. Pure white. 1892.
 — *Statteria'na*. See *C. aurea*, var. *Statteriana*.
 — *Veda'sti*. Garden hybrid. Orch. 1891, p. 48.
 — *Victoria-regi'na*. Reddish; lip white, crimson. Brazil. 1892.
 — *Warocqua'na amethystina*. Rosy-purple, orange, maroon. 1891. Lind. t. 268.

Cautle'ya.

- C. spica'ta*. 1. Purple. June. Nepal. 1820. Syn., *Roscoea spicata*.

Ceano'thus.

- C. la'niger*. See *Pomaderris lanigera*.

Cela'strus.

- C. pyraca'nthus* is a synonym of *Putterlickia pyracantha*.

Centrose'ma. See *Siphocampylus*.**Cera'stium.**

- C. decal'vans*. White. June. Servia. 1892.

Ceratosti'gma.

- C. plumbagino'i'des*. 2. Blue. July. China. 1845. Syn., *Plumbago Larpentæ*.

Ce'bera.

C. undulata. See *Ochrosia borbonica*.

Ce'reus.

C. Sargentii nus. 15. Pink. Lower California. 1891.

Chætothylax.

C. eustachya na. Red, yellow. Summer. W. Indies. Syn., *Justicia eustachiana*. B. M. t. 2076.

Chamædo'rea.

C. stolonifera. 3. Yellow. S. Mexico. 1892. B. M. t. 7265.

Chamæli'rium. *Helonias lutea* and *H. pumila* are now included in this genus.

Chamæ'rops.

C. hystrix. See *Rhaphidophyllum hystrix*.
— *Murtia* na. See *Trachycarpus khasyanus*.

Cheira'nthera.

C. parviflora. Purple. W. Australia. 1892. B. M. t. 7261.

Cheiro'stylis.

C. marmorata is a synonym of *Dossinia marmorata*.

Chionodo'xa.

A hybrid has been raised between *C. Lucilia* and *Scilla bifolia*.

C. Luciliae Alle'ni. Blue, white, pink. March. Mount Taurus. 1892.

Chiri'ta.

C. depressa. Purple. China. 1892. B. M. t. 7213.

Chiro'nia.

C. angustifolia, *C. decussa'ta*, and *C. frutescens* are synonyms of *Orpium frutescens*.

Chlorophytum.

C. nepalense. Syn., *Phalangium nepalense*. B. R. t. 998.

Cimici'fuga.

C. palma'ta is a synonym of *Trautvetteria palmata*.

Cirrhop'e'talum.

C. Amesia'num. Rosy-purple, yellow. Dutch Indies. 1892. Lind. t. 314.

— *Colletia'num*. Dark purple, yellow. Upper Burmah. 1891. B. M. t. 7198.

— *elegantulum*. Pale, maroon-purple. Madras. 1891.

— *Wendlandia'num*. Purple. British Burmah. 1891.

Ci'ssus.

C. porphyrophyllus is a synonym of *Piper porphyrophyllus*.

Ci'trus.

C. buxifolia is a synonym of *Severinia buxifolia*.

Cle'matis.

C. brevicauda'ta. China. 1888. Syn., *C. Pieroti*.

Clia'nthus.

C. carneus is a synonym of *Strebilorrhiza speciosa*.

Cliveu'charis.

C. pulchra. A hybrid between *Clivia miniata* and *Eucharis grandiflora*. 1891.

Cochlio'da.

C. Næzlia'na. Andes. 1891. Lind. t. 266. Syn.,

Odontoglossum Næzlianum.

— *sanguinea*. Deep rose. Ecuador. 1867.

Syn., *Mesospinidium sanguineum*.

— *vulcanica*. Lake, rose. Peru. 1872. Syn.,

Mesospinidium vulcanicum.

Co'cos.

C. Norma'nbyi. See *Ptychosperma Normanbyi*.

— *Pynce'rtii*. A seedling form of *C. Weddelliana*. G. C. 1891, xi. p. 683.

Cœlo'gyne.

C. cu'prea. G. C. 1892, xi. p. 619.

— *Micholitzia'na*. White, brown. Macassar. 1891.

Co'lechiem.

C. Bornmuller'i. Purplish. May. Orient. 1892.

— *Decaisnei*. Rosy-purple. Lebanon. 1892.

Co'leus.

C. Penz'gii. Blue. Abyssinia. 1892.

Colorado Beetle. *Doryo'phora decemlineata*.

Colu'tea.

C. melanocalyx. Yellow; calyx covered with dark hairs. Asia Minor. 1892.

Corallobo'trys.

C. acuminata. 4. Red. Khasia. Syn., *Epi-gynium acuminatum*. B. M. t. 5010.

Cory'anthes.

C. leucocorys. Greenish-yellow, brownish-purple, white. Peru. 1891. Lind. t. 293.

— *macrocor'rys*. Yellowish-white, purple. Peru. 1892. Lind. t. 342.

Co'smos.

C. spectabilis. Garden hybrid. Rev. Hort. 1892, p. 372, figs. 114, 115.

Co'stus.

C. Engleria'na. White, yellow. Tropical Africa. 1892. Syn., *C. unifolius*.

— *Lucanusia'na*. Purple, yellow. Cameroons. 1892. Gf. t. 1379.

Cra'ssula.

C. Schweinfurthii. White. Abyssinia. 1892.

Craterosti'gma.

C. pulchrum. Lilac, purple, white. India. 1871. Syn., *Torenia auriculatafolia*. Flor. Mag. t. 534.

Cri'num.

C. abyssinicum. White. Abyssinia. 1892. Gf. 1892, p. 412, fig. 89.

— *firmifolium*. White? Madagascar! 1892.

— *jemense*. White. Arabia. 1892.

— *Roozenia'num*. White; filaments red. Jamaica. 1891.

— *yucoeyfolium*. White. Abyssinia. 1892.

Croco'sma.

C. aurea. 2. Orange. July. S. Africa. 1846. Syn., *Tritonia aurea*. B. M. t. 4335.

Cro'cus.

C. biflorus Leichtli'ni. White or pale purple. Mardin. 1891.

— *Bilho'vii*. Rich purple. February. Stauros. 1892.

— *hyemalis Fo'xii*. White, yellow; anthers black. January. 1892.

— *margaritaceus*. Pale blue, striped with violet outside. B. R. 1847, t. 16.

Crotalaria.

- C. angustifolia.* See *Lebeckia sericea*.
— *pulchella.* See *Lebeckia cytisoides*.

Cryptarrhena. (Nat. ord., *Orchidaceæ*; Tribe, *Vandeeæ-Oncidiaceæ*.)

- C. luna* ta. Greenish; lip yellow. B. R. t. 153.

Cryptocarpus.

- C. globosus.* Variegated. June. Cuba. 1830.
Syn., *Salpianthus purpurascens*.

Cryptophoranthus.

- C. atropurpureus*. $\frac{1}{2}$. Dark purple. Jamaica. 1838. Syns., *Masdevallia fenestrata*, B. M. t. 4164, and *Pleurothallis atropurpureus*.

Cudrania.

- C. triloba*. China. 1872. Syn., *Maclura tricuspidata*.

Curculigo.

- C. veratrifolia*. 2. Yellow. June. S. Africa. 1778. Syn., *Hypoxis veratrifolia*.

Cucuma.

- C. Bakeriana*. Orange. New Guinea. 1892.

Cusparia.

- C. undulata*. White. Brazil. 1892.

Cyclamen.

- C. alpinum*. Purplish-red. Asia Minor. 1892.
— *tauricum*. Pure white. Taurus. 1892.

Cyclogyne.

- C. canescens* is a synonym of *Swainsonia canescens*.

Cynoches.

- C. peruvia* num. Green, purplish-brown, white. Peru. 1891. Lind. t. 301.
— *Rossiana* num. Male yellowish-green; female bright green. 1891.

Cylista.

- C. albiflora* is a synonym of *Rhynchosia cyanosperma*, var. *albiflora*.

Cymbidium.

- C. Humboldtii*. Green, black. Madagascar. 1892.
— *Huttoni*. See *Grammangis Huttoni*.
— *Lowiana* num *viride*. Greenish-yellow. 1892.
— *pulcherrimum*. White, crimson. N. India. 1891.
— *Winnia* num. Garden hybrid. 1892.

Cynanchum.

- C. minus*. See *Vincetoxicum fuscatum*.

Cypripedium.

- C. californicum*. Dull yellow; lip white, spotted with pale brown. May. California. 1891. B. M. t. 7188.
— *Chamberlainiana* num. 2. Rosy-purple, white. New Guinea. 1892. G. C. 1892, xi, 284, fig. 34.
— — *excelsens*. A variety with pale dorsal sepal. 1892.
— *ezul*. A variety of *C. insigne*. G. C. 1892, xi, p. 522, fig. 77.
— — *Imshoottiana* num. A variety with narrower perianth segments. Siam. 1892.
— *Godefruyi* *luteum*. Yellow, pale rosy-lilac. 1891.
— *insigne longispalum*. An unspotted variety. 1891.

The following hybrids were described during 1891-92: *Adra'stus*, *Albertiana* num, *Alci'des*, *ama-*

bile, *Bac'nis*, *Bro'uni*, *Bry'ani*, *Bry'sa*, *Céres*, *Chryso'comes*, *Clappa'tra*, *Corringia* num, *Cowleya* num, *Dai'syæ*, *Desboisiana* num, *Desboescheria* num, *de'orum*, *E'di'tha*, *Engelhardtæ*, *Eury'lochus*, *fé'stum*, *g'gas*, *He'cla*, *Ja'nthe*, *Java'nico-spiceria* num, *Johnsoniana* num, *Ju'no*, *Lavrebel'ium*, *Le'da*, *macroch'ilum*, *Macfarlanei*, *Nio'be* var. *super'bum*, *O'rphæus*, *Pa'llas*, *Pe'ræus*, *southgate'nsis*, *Swinburnei*, *Tel'machus*, *Ti'tyus*, *Von Molia* num, *Warne'ro-super'biens*, *Youngiana* num var. *super'bum*.

Cyrta'nthera.

- C. catalpa'folia*. See *Jacobinia aurea*.
— *chryso'ste'phana*. See *Jacobinia chryscste-phana*.

Cyrta'nthus.

- C. Galpi'ni*. Bright red. August. Transvaal. 1892.
— *parviflorus*. Bright scarlet. January. 1891.

Cyrtium.

- C. falcatum pedunculatum*. A narrow variety of pendulous habit. 1892.

Cyrtosperma.

- C. fé'rox*. Greenish-white. Borneo. 1892. III. Hort. new ser. t. 153.

Cytisus.

- C. fra'grans*. Syn., *Spartium nubigenum*.
— *schiepkæ'nsis*. 1. White. Balkan Mountains. 1892.

D.

Dabœ'cia.

- D. cantabrica calyculata*. Red or white. Garden variety. 1891.

Damasodium.

- D. indicum*. A synonym of *Ottelia indica*.

Da'phne.

- D. glomerata*. Lilac-purple. Caucasus. 1891.

Daphnopsis.

- D. cora'folia*. $\frac{1}{2}$. Blue. April. 1846. Syn., *Nordmannia cordifolia*.

Dendrobium.

- D. barbatulo-chlorops*. A supposed natural hybrid. 1892.
— *bigibbum albomarginatum*. Flowers edged with white. 1892. Lind. t. 317.
— *chrysoe'phalum*. Golden-yellow. 1892.
— *Dalhousiana* num *luteum*. Straw-yellow. India. 1891.
— *densiflorum clavatum*. White, yellow. Shan States. 1892.
— *Leea* num. White, rose, green. New Guinea. 1891.
— *ni'veum*. See G. C. 1891, ix, p. 104.
— *Obrieniana* num. Yellowish-green. Philippine Islands. 1892.
— *Phalaenopsis Rothschildiana*. Snowy-white, pink. 1892.
— *punctatum*. See *Dipodium punctatum*.
— *Wardia* num *alatum*. White, orange-yellow. India. 1892. Warn. Orch. Alb. t. 450.

The following are garden hybrids described during 1892: *Adra'sta*, *burfordiense*, *du'loc*, *euo'stum leuco'pterum*, *Eury'clea*, *Ne'stor*, *Ro'lfææ*, *strid'um*, and *Wardia'no-japonicum*.

Dendrochilum.

- D. cucumerinum*. See *Platylinis cucumerinum*.

Dendrospar'tium.

D. æthnense. 3. Yellow. July. Sicily. 1816.
Syn., *Genista æthnense*.

Dia'nthus.

D. Brivatensis. Hybrid between *D. superbus* and *D. barbatus*. 1892.

— *callizonus*. Rosy-purple, darker in the centre. June. Transylvania. 1892. B. M. t. 7223.

— *Freymii*. Purple. May. Bosnia. 1892.

Dichæ'a.

D. glauca. Green, purple. June. Mexico. 1837. Syn., *Epidendrum glaucum*.

Dichorisa'ndra.

D. angustifolia. Ecuador. 1892. Ill. Hort. new ser. t. 158.

— *musaica gigantea*. A robust variety. 1892.

Didymocarpus.

D. lacunosa. Violet-blue. Penang. 1892. B. M. t. 7236.

Dieffenbachia.

D. meledgris. Ecuador. 1892. Ill. Hort. new ser. t. 159.

— *O'lbiana*. Peru. 1892. Ill. Hort. new ser. t. 148.

— *picturata*. Venezuela. 1892. Ill. Hort. new ser. t. 162.

Diera'ma. (From *dierama*, a funnel; in allusion to the shape of the flowers. Nat. ord., *Iridaceæ*; Tribe, *Ixiææ*.)

D. pendula. 1. Dark or pale pink. June. South Africa. 1825. Syn., *Sparaxis pendula*. B. R. t. 1360.

— *pulcherrima*. 5. Blood-purple. Cape Colony. Syn., *Sparaxis pulcherrima*. B. M. t. 5555.

Digitalis.

D. ciliata. Summer. Caucasus. 1892.

Diosma.

D. Wendlandii. White. S. Africa. 1892.

Dipeadi.

D. viridis. Syn., *Zuccagnia viridis*.

Di'pidax.

D. ciliata. $\frac{1}{2}$. Pale yellow. June. S. Africa. 1810. Syn., *Melanthium ciliatum*. *M. secundum* is a white-flowered form.

Dipodium.

D. pictum. 1. Yellow, crimson. Java. 1849. Syn., *Wattlesia picta*.

— *punctatum*. 1-2. Red, purple. Australia. 1822. Syn., *Dendrobium punctatum* and *Wattlesia punctata*.

Di'sa.

D. Cooperi. Rosy-carmine, lip yellow. S. Africa. 1892. B. M. t. 7256.

— *incarnata*. Orange-red. Madagascar. 1892. B. M. t. 7243.

Di'sporum.

D. lanuginosum is a synonym of *Streptopus lanuginosus*.

Disso'tis.

D. villosa. 3. White. July. Brazil. 1820. Syn., *Pteroma villosa*.

Dolichandro'ne.

D. Rheedii. 16. Cream. E. Indies. 1749. Syn., *Spathodea longiflora* and *S. Rheedii*.

Dracæ'na.

D. Coulli'ngii. A hybrid. 1892.

— *Sanderia'na*. Leaves green striped with white. 1892.

E.

Echeve'ria.

E. Fuhl'ni. A seedling form. 1892.

Echidno'psis.

E. Dammanniana. Brown. Abyssinia. 1892.

Echinea.

E. angustifolia is a synonym of *Rudbeckia paltda*.

Eleutheri'ne.

E. plicata. 1-1. White. Tropical America. Syn., *Moraea plicata*, *M. palmifolia*, *Marica plicata*, B. M. t. 655, and *Sisyrinchium palmifolium*.

Emmena'nthe. (Nat. ord., *Hydrophyllaceæ*.)

E. penduliflora. 2. Yellowish. July. California. 1892.

Ence'lia. See also *Pallasia* and *Ximensia*.

Epidendrum.

E. Godseffianum. Brown, white, rosy-purple. Brazil. 1892. Syn., *E. Copartianum*. Lind. t. 333.

— *Mantinia'num*. Pale green, dotted with purplish-brown. Ill. Hort. new ser. t. 150.

— *Ortgiesii*. Red, white, purple. 1892.

— *Watsonianum*. Brazil. 1892.

Eranthemum.

E. coccineum. See *Thyrsacanthus Lemaireanus*.

Eremo'phila. *Stenochilus* (which see) is now united with this genus.

Eremospar'tum.

E. aphyllum. Syn., *Genista aphylla* and *Spartium aphyllum*.

E'ria.

E. Laucheana. Green, purple. 1892.

— *vestita*. White, reddish-brown. 1892.

Eritri'chium.

E. nothofolium. White. California. 1892.

Esmeralda. See *Arachnanthe*.

Eu'charis.

E. Clibrani. See *Urceocharis Clibrani*.

Eu'comis.

E. bifolia. See *Whiteheadia bifolia*.

Eulophie'lla.

E. Elizabethæ. White; lip yellow. 1892. Lind. t. 325.

Eulophia.

E. Mackenii. Pink, white. Natal. 1892.

Eupato'rium.

E. scandens. Jacq. Ic. t. 169. See *Mikania scandens*.

Eupho'rbia. Syn., *Poinsettia*.

E. canalicula'ta, B. C. t. 727, and *E. carina'ta*, B. R. t. 837 are synonyms of *Pedilanthus tithymaloïdes*.

Eu'ryops.

E. pectina'tus. 2. Yellow. May. S. Africa. 1731. Syn., *Othonna pectinata*. B. M. t. 306.

— *virgi'neus*. 3. Yellow. October. South Africa. 1821. Syns., *Othonna flabelli'folia*, B. C. t. 728, and *O. virginea*.

Euta'xia.

E. microphy'lla. 2. Yellow. May. Australia. 1803. Syn., *Sclerothamnus microphy'llus*.

Eute'rpe.

E. monta'na. A synonym of *Prestœa montana*.

Evo'dia.

E. frazini'folia. 2. Whitish. April. Cochinchina. 1822. Syn., *Tetradium trichotomum*.

F.

Fa'gus.

F. sylva'tica fo'liis stria'tis. Leaves with golden stripes parallel with the nerves. Hesseia. 1892.

— — *Zla'tia*. Leaves golden-tinted. Servia. 1892.

Fi'cus.

F. Sycomor'us. 30. Egypt. Syn., *Sycomorus antiquorum*.

— *variega'ta*. 4. South Africa. 1816. Syn., *Sycomorus capensis*.

Fra'xinus.

F. raiboca'rya. Central Asia. Wien. Gartz. 1892, p. 111, fig. 36.

G.

Gala'ctia.

G. filifo'rmis. 3. Purple. July. S. America. 1820. Syn., *Sweetia filiformis*.

— *longifo'lia*. 4. Purple. S. America. 1818. Syn., *Sweetia longifolia*.

— *tenuifo'lia*. 5. Purple. St. Domingo. 1824. Syn., *Sweetia lignosa*.

Gale'ga.

G. du'bia. Jacq. Ic. t. 576. See *Lessertia dif'fusa*.

Garci'nia. See also **Xanthochymus**.

Garde'nia.

G. Ra'ndia. B. M. t. 1841. See *Randia aculeata*.

Gaylussa'cia.

G. brachy'cera. 1. White. May. N. America. Syn., *Vaccinium buxifolium*. B. M. t. 928.

Geissorhi'za.

G. roche'nsis. Violet-purple. Cape Colony. Syn., *Ixia rochenis*. B. M. t. 598.

— — *spitha'mœa*. A more robust variety.

Gentia'na.

G. orega'na. 1-2. Blue. September. North America. 1892.

G. visco'sa. B. M. t. 2185. See *Izanthus viscosus*.

Ge'snera.

G. ama'bilis. B. M. t. 5085. See *Nœgelia multiflora*.

Ge'um. See also **Sieversia**.

Gi'lia.

G. dichotoma. 1½. Pink. California. 1838. Syn., *Linanthus dichotomus*.

Gladi'olus.

G. armeni'acus. Deep purple. July. Armenia. 1892.

— *oppositifo'rus*. 6. White, purple. October. S. Africa, not Madagascar as previously believed. Re-introduced 1892.

— *secu'riger*. B. M. t. 383. See *Tritonia securigera*.

Glo'bba.

G. purpu'rea. Andr. Rep. t. 615. See *Mantisia saltatoria*.

Glyci'ne.

G. chine'nsis and *G. sine'nsis* are synonyms of *Wistaria sinensis*.

— *hi'spida*. 3. Violet. July. E. Indies. 1790. Syns., *Dolichos Soja* and *Soja hispida*.

Goode'nia.

G. filifo'rmis. Yellow. Australia. 1841. Syn., *Velleia lanceolata*.

Grinde'lia.

G. coronopifo'lia. See *Xanthocephalum centauroides*.

Guatte'ria.

G. cerasoi'des and *G. subero'sa*. See *Polyalthia cerasoides* and *P. suberosa*.

Guizo'tia.

G. olei'fera. Syn., *Veslingia sativa*.

Gutierre'zia.

G. gymnospermoï'des. See *Xanthocephalum gymnospermoides*.

Gymnolo'mia.

G. macula'ta. See *Wulffia maculata*.

Gynopleu'ra.

G. linearifo'lia. 1½. Purple, blue. September. Chili. 1831. Syns., *Malesherbia coronata*, *M. fasciculata*, and *M. linearifolia*, B. M. t. 3362.

Gynu'ra.

G. sarmento'sa. Orange. Malaya. 1892. B. M. t. 7244.

Gypso'phila.

G. Raddea'na. Pale pink. Persia. 1892. Gf. t. 1365, figs. 5-8.

H.

Habena'ria.

H. longicalca'ra. White. Western Ghauts of India. 1892. B. M. t. 7228.

Hale'sia.

H. tetra'ptera Meeha'ni. A seedling variety. 1892.

Heberde'nia.

H. excel'sa. 20. Red. July. Madeira. 1784. Syns., *Ardisia excelsa* and *Myrsine Heberdenia*.

He'ctea.

H. Elleme'e'i. See *Rhodostachys Ellemeeti*.
— *pitcairniaefolia*. See *Rhodostachys pitcairniaefolia*.

Helichry'sum. Syn., *Swammerdamia*.

Helico'nia.

H. spectabilis. Leaves green above, dull purple beneath; midrib red. Tropical Asia. 1892. Ill. Hort. new ser. t. 156.

Heli'pterum. Syn., *Rhodanthe*.

H. Mangle'sii. Syn., *Rhodanthe Manglesii*.

Helo'nias.

H. gramin'nea is a synonym of *Stenanthium angustifolium*, var. *gramineum*.
— *virginica* is a synonym of *Melanthium virginicum*.

He'speris.

H. arabidiflora. See *Parrya arabidiflora*.

Heterophra'gma.

H. adenophyllum. E. Indies. 1822. Syn., *Spathodea adenophylla*.

He'vea. Syn., *Siphonia*, which see.

Hology'ne. See *Lasthenia*.

Homogy'ne.

H. alpi'na. $\frac{1}{2}$. Lilac, purple. April. 1710. Syn., *Tussilago alpina*.

Hue'nia.

H. Penz'gii. $\frac{1}{2}$. Blackish-purple. Abyssinia. 1892. Syn., *H. macrocarpa*.

Hyaci'nthus.

H. botryoi'des. See *Muscari botryoides*.
— *comosus*. See *Muscari comosum*.
— *racemosus*. See *Muscari racemosum*.

Hudnophy'tum.

H. Forbe'sii. White. New Guinea. 1892. B. M. t. 7218.

Hy'drocleis.

H. Commers'oni. $\frac{1}{2}$. Yellow. May. Brazil. 1831. Syn., *Limncharis Humboldtii*. B. R. t. 1640.

Hyospa'the.

H. pubi'gera. See *Prestaea pubigera*.

Hypochæ'ris. See also *Seriola*.

I.

Illawarra Pine. *Podocarpus spinulosa*.

Impa'tiens.

I. Michol'tzi. White, rose. New Guinea. 1892.

Ioni'dium. Syn., *Solea*.

Ipomœ'a. Syn., *Skinneria*.

I. Brons'oni. Cuba. 1892.
— *limifo'lia*. Yellow. May. E. Indies. 1827. Syn., *Skinneria cœspitosa*.

I'ris.

I. asia'tica. Gard. 1892, xli., p. 121.
— *mad'onna*. Lilac-blue. Arabia. 1892. Evergreen.
— *maricoi'des purpu'rea*. Purple. Syria. 1892.
— *nepale'nsis Le'tha*. Blue. Summer. Upper Burmah. 1892. Fragrant.
— *pa'rabi'da*. Hybrid between *I. iberica* and *I. paradoxa*. May. 1892.

Ischnosi'phon.

I. Parke'ri. 2. Yellow. July. Grenada. 1823. Syn., *Phrynium Parkeri*.

Isolo'ma. Syn., *Sciadocalyx*.

I. ignora'tum. Yellow, scarlet. Central Amer. Syn., *Kœhleria ignorata*.
— *rupe'stre*. Red. Nicaragua. 1871. Syn., *Kœhleria rupestris*.
— *Warszewiczii*. Syn., *Sciadocalyx Warszewiczii*, which see.

I'xia.

I. bi'color. A synonym of *Synnotia bicolor*.

Ixioli'rion.

I. macra'nthum. Deep blue, purple. 1892.
— *Sinten'i'st*. Blue. 1892.

Ixo'ra.

I. fe'rrea. 20. Pink. W. Indies. 1793. Syn., *Siderodendron triflorum*.
— *salmo'nea*. Salmon, buff. 1892. Garden variety.

J.

Jankæ'a.

J. Heldrei'chii. A synonym of *Rimondia serbica*.

Jo'hnia. See *Salacia*.

Juri'nea.

J. linearifo'lia. 2. Purple. July. Siberia. 1816. Syns., *Serratula multiflora* and *S. linearifolia*.
— *mollis*. 2. Purple. July. Transylvania. 1818. Syn., *Serratula transylvanica*.
— *Poll'i'chii*. 2. Red. July. Siberia. 1778. Syn., *Serratula cyanoides*.

Justi'cia.

J. lila'cina. See *Thyrsacanthus callistachyus*.
— *longiracemo'sa*. See *Thyrsacanthus Lemaireanus*.

K.

Kalancho'e.

K. marmora'ta. White. Abyssinia. 1892. B. M. t. 7333.

Ke'ntia.

K. Macarthu'rice. See *Ptychosperma Macarthuriae*.

Kla'ttia.

K. parti'ta. 1-2. Bright blue. April. Cape Colony. 1822. Syn., *Witsenia partita*.

Knipho'fia.

K. Nelso'ni. 2. Orange-scarlet. Orange Free State. 1892.
— *paucifo'ra*. Pale yellow. March to July. Natal. 1892. B. M. t. 7269.

Ku'nzea.

K. seri'cea. Rose. May. Swan River. Syn., *Salisia pulchella*.

L.

Labi'sia.

L. smaragdina. Pink. Borneo. 1892. Ill. Hort. new ser. t. 160.

Læ'lia.

- L. a'nceps ama'bilis*. White, yellow, purple. 1889.
 — — *Owenia'na*. A richly coloured variety. 1892.
 — — *Schræde'ra*. Pale rose, brown, yellow, purple. 1887.
 — — *Sté'lla*. White, yellow, carmine. 1887.
 — — *virgí'na'tis*. White, pale sulphur-yellow. 1887.
 — *autumna'lis a'lba*. Pure white. 1889.
 — — *xanthotro'pis*. Rosy-purple, yellow. Mexico. 1887.
 — *cri'spa Cawwela'rtia*. Lip greenish-yellow at the base. Brazil. 1891. Ill. Hort. new ser. t. 121.
 — *delle'nsis*. A garden hybrid. 1889.
 — *Digby'na-Mo'ssica*. A fine hybrid between *L. Digbyana* and *Cattleya Mossica*. G. C. 1889, v. pp. 658 and 742.
 — *e'legans exce'llens*. Rosy, white. 1892.
 — *Gottol'na*. Rose, purple, maroon. 1891.
 — *grá'ndis tenebro'sa*. Coppery-bronze, purple, white. Brazil. 1891. Rchb. ser. 2, t. 33.
 — *irrorá'ta Gaskellia'na*. Pale lilac, purple, lilac. 1887.
 — *Lato'na*. Garden hybrid. 1892.
 — *lila'cina*. Pale lilac, white, purple. 1887.
 — *Owenia'na*. Garden hybrid. 1892.
 — *pro'stans a'lba*. Ivory-white, crimson. 1889.
 — *pu'mila Curlea'na*. Purple with darker streaks. 1886.
 — *purpura'ta Handleya'na*. Dark coloured variety. 1892.
 — — *Lowia'na*. Rose, mauve-purple, yellow. 1887.
 — *rube'scens a'lba*. White, yellow. 1887.
 — — *ro'sea*. Syn., *L. peduncularis*. B. R. 1845, t. 69.
 — *sup'e'rbiens Quesnelia'na*. Rosy-mauve, magenta-purple, yellow. Mexico and Guatemala. 1889. Warn. Orch. Alb. t. 383.
 — *Victo'ria*. A garden hybrid. 1889.

Læ'lio-Ca'ttleya.

The following hybrids have been raised, in addition to those mentioned on p. 540: *Aurora*, *Cassiope*, *elegans* var. *Cookiana*, *Ingramii*, *Martriottiana*, *Phæ'be* and *Sté'lla*.

Lagena'ria.

L. virgí'na'tis. Fruit waxy white. G. C. 1892, xi. p. 85, fig. 16.

La'mium.

L. Orva'le. B. M. t. 172. See *Orvala lamioides*.

Lando'phia.

L. fo'rida. White. Tropical Africa. 1887. B. M. t. 6963.

Lapeyrou'sia. This name now supersedes *Peyrousia*, which see.

L. grandiflo'ra. 1. Bright red, yellow, crimson. S. E. Tropical Africa. 1887. Syn., *Anomatheca grandiflora*.

Lasiogro'stis.

L. Calamagro'stis is a synonym of *Stipa Lasia-grostis*.

Lasiopetalum.

L. quercifolium. See *Thomasia quercifolia*.

Lasi'opus.

L. sonchoides. See *Taraxacum montanum*.

Lasiosi'phon.

L. anthylloides. Yellow. S. Africa. 1889.

Lastræ'a.

L. Jenma'ni. Jamaica. Syn., *Nephrodium Jenmani*.
 — *le'pida*. G. C. 1886, xxvi. p. 681.

La'tace.

L. Volkma'nni. White. Andes of Santa Rosa. 1889. Gf. t. 1302, fig. 1.

Lau'rus.

L. Sa'safras. See *Sassafras officinale*.

Lepa'chys. See *Rudbeckia*.**Lepto'tes.**

L. bi'color bre'vis. A variety of *Tetramicra bicolor* with a white lip. 1892.

Li'lium.

L. primu'num. Pale yellow, greenish. Upper Burmah. 1892. B. M. t. 7227.
 — *sulphu'reum*. Yellow, tinged with crimson outside. B. M. t. 7259. Syn., *L. ochroleucum* and *L. Wallichianum*, var. *superbum*.

Limna'nthemum. See also *Meyanthes* and *Villarsia*.

Limnophy'ton.

L. obtusifolium. 2. White. July. China. 1804. Syn., *Sagittaria obtusifolia*.

Lisso'chilus.

L. Græ'fei. Green, brown, yellow. 1892.

Loni'cera.

L. syringa'ntha. Pale pink. N. China. 1892.

Ly'chnis.

L. a'spera. Syn., *Viscaria oculata*.

Lycopo'dium.

L. Moorea'num. Brazil. 1892.

M.

Macdona'ldia. See *Thelymitra*.

Macfayde'nia.

M. corymbo'sa. 6. Yellow. Trinidad. 1824. Syn., *Spathodea corymbosa*.

Macrade'nia.

M. mu'tica. See *Trichopitia mutica*.

Macrolo'bium. Syn., *Vouapa*.**Maia'nthemum.**

M. Convalle'ria. $\frac{1}{2}$. White. June. N. America. 1812. Syn., *Smitacina canadensis*.

Ma'mmea.

M. africa'na is a synonym of *Ochrocarpus africanus*.

Mapa'nia. Syn., *Pandanophyllum*.**Mara'nta.**

M. chimborace'nsis. Ill. Hort. 1870, t. 6.
 — *Sanderia'na*. G. C. 1892, xi. p. 731.

Ma'rica.

M. occidenta'lis. Yellow. Peru. 1892.

Masdevallia.

M. Harryana Gravel'sia. Pure white. 1892.

The follow hybrids were raised in 1892: *Cassiope falcata*, *McVittie* and *Shuttryana*.

Maxillaria. See also **Xylobium.**

M. densa. B. R. t. 1804. See *Ornithidium densum*.

Meconopsis.

M. diphylla and *M. petiolata* are synonyms of *Stylophorum diphyllum*.

Me'ntha.

M. punctata. See *Preslia cervina*.

Merte'nsia.

M. pulmonarioides. 1½. Blue. April. N. America. 1799. Syn., *Pulmonaria virginica*. B. M. t. 160.

Mi'crodon.

M. cylindrica. ¾. Purple. August. S. Africa. 1807. Syn., *Selago polygaloides*.

— *lucida*. 1½. Purple. June. S. Africa. 1812. Syn., *Selago bracteata*.

— *ovata*. 1. Dark purple. August. S. Africa. 1774. Syns., *Selago ovata*, B. M. t. 186, and *S. spicata*.

Micromé'ria.

M. nervosa. 1. Purple. Ionian Islands. 1820. Syn., *Satureia nervosa*.

Micro'stylis.

M. Scottii. ¾. Green, purple. Malaya. 1892. B. M. t. 7268.

Milto'nia.

M. Clowesii gigantea. Garden variety. 1892.

Mimo'sa.

M. guianensis. See *Stryphnodendron guianense*. — *Spagazinii*. Stamens pale violet. Argentina. 1892.

Mirbe'lia.

M. Baxteri is a synonym of *Oxylobium scandens*.

Moni'zia.

M. edulis. A synonym of *Thapsia edulis*.

Monodo'ra.

M. grandiflora. B. M. t. 7260.

Montano'a.

M. arboreascens. 3. Yellow. July. Mexico. 1823. Syn., *Verbesina atriplicifolia*.

N.

Nau'clea.

N. coadunata. See *Sarcocephalus cordatus*. — *Gambir*. 10. Pale red. E. Indies. 1825. Syn., *Uncaria Gambir*.

— *sessilifru'tus*. 10. Pale red. E. Indies. 1829. Syn., *Uncaria sessilifru'tus*.

Neme'sia.

N. strumosa. 1-2. Very variable in colour, white, ochre, pale yellow, orange, scarlet, carmine, or rosy-purple. August. South Africa. 1892. B. M. t. 7272. Hardy annual.

Neo'ttia. See also **Spiranthes.****Nephrole'pis.**

N. dallii des m'lticeps. A crested variety. 1892.

Nicotia'na.

N. tomentosa. B. M. t. 7252. This name supersedes *N. collosa*.

Nola'na.

N. rostrata. A synonym of *Osteocarpus rostratus*.

Nothosco'r'dum.

N. aureum. A synonym of *Bloomeria aurea*.

Nymphæ'a.

N. Laydekeri rosea. Rosy-pink. A hybrid? 1892.

O.

O'cimum.

O. viscosum. 1½. Blue. August. E. Indies. 1826. Syn., *Plectranthus viscosus*.

Odontoglo'ssum.

O. Andersonianum pulcherrimum. Pale yellow, blotched with brownish-red. 1892.

— *crispum nobiliss*. White, brownish-red. 1892.

— *Rea*. Rosy, chestnut. 1892.

— *Sanderæ*. A variety with numerous spots. 1892.

— *zeanthotes*. White, with yellow spots. Columbia. 1892.

— *Owenianum*. White, yellow, brown. Columbia. 1892.

— *Pescatorei Lindénia*. Each sepal and petal bears one large purple blotch. 1892. Lind. t. 329.

— *platycheilum*. Creamy-white, pink, purple. Central America? G. C. 1892, xi. p. 587, fig. 84.

— *triumphans aureum*. Yellow, orange. Columbia. 1892. Warn. Orch. Alb. t. 460.

— *Wickednum nobilior*. A pale coloured variety. 1892.

CENO'thera.

C. dentata. 1. Yellow. August. Russia. 1836. Syns., *Sphaerostigma hirtum* and *S. Chamissonis*.

— *minutiflora*. 1. Yellow. August. Russia. 1837. Syn., *Sphaerostigma minutiflorum*.

Oncidium.

- O. Enderianum*. A supposed natural hybrid. G. C. 1892, xi. pp. 535 and 650, fig. 94.
 — *Gravesia num.* Yellow, brown. S. Brazil. 1892.
 — *Rolfea num.* Yellow, brown. Columbia. 1892.
 — *Saintlegeria num.* 1½. Yellow, bright purple. S. Brazil. 1892

Onobrychis.

- O. iacónica.* Bright pink. Summer. Servia. 1892.

Oporanthus.

- O. lutea.* A synonym of *Sternbergia lutea*.

O'rchis.

- O. bicornis.* See *Satyrium cucullatum*.

Oreodaphne.

- O. californica.* A synonym of *Umbellularia californica*.

Oreopanax.

- O. Sanderianum.* Greenish. Guatemala. 1892.

O'robos.

- O. lathyroides.* A synonym of *Vicia oroboides*.

Orthocarpus.

- O. erianthus roseus.* 1. Cream to purple. June. N. America. Syn., *Triphysaria versicolor*.

Otte'lia.

- O. alismoides.* White. July. E. Indies. 1806. Syn., *Stratiotes alismoides*.

Oxypetalum.

- O. cœruleum.* 3. Blue. July. Tucumania. 1836. *Tweedia cœrulea* and *T. versicolor*. B. M. t. 3630.
 — *solanoides.* Pink. July. Brazil. 1838. Syn., *Tweedia floribunda*, *T. pubescens* and *T. rosea*.

P.

Palicourea.

- P. spicata.* Syn., *Psychotria lineata*.

Pandanus.

- P. Dyerianus.* A variegated form of *P. lævis*. 1892.
 — *pacificus.* Pacific Islands. 1892.

Pasi'thea.

- P. cœrulea.* B. M. t. 7249.

Passeri'na.

- P. hirsuta* is a synonym of *Thymelæa hirsuta*.
 — *Stelleri* is a synonym of *Stellera chamaejasme*.

Pelargonium. Syn., *Seymouria*.

- P. multibracteatum.* White. Abyssinia. 1892.

Pele'xia.

- P. Travassosii.* 1. White. Brazil. 1892.
 — *Wendlandiana.* 2. Greenish-brown, white. 1892.

Pentapetes.

- P. suberifolia.* A synonym of *Pterospermum suberifolium*.

- Pentroge'ton.** A synonym of *Cras-sula*.

Peperomia.

- P. metallica.* Leaves dark green, veined with pale green and red. Peru. 1892. Ill. Hort. new ser. t. 157.

Peristea.

- P. Lindeni.* Pale and dark purple. 1892. Lind. t. 328.

Perne'ttya.

- P. phyllireæfolia.* 1. White. Peru. 1812. Syn., *Arbutus phyllireæfolia*.

Peti'tia.

- P. oleina.* 2. Green, white. May. Mexico. 1840. Syn., *Scleröon oleinum*.

Phai'us.

- P. hybridus.* A hybrid between *P. grandifolius* and *P. Wallichii*.
 — *Sanderianus.* Probably a hybrid. 1892.

Phalæno'psis.

- P. Amphitrite* and *P. Artemis* are garden hybrids. 1892.
 — *Schilleriana purpurea.* Dark rosy-purple. 1892.

Phylloca'ctus.

- P. Franzii.* A garden hybrid. 1892. Gfl. t. 1370, fig. 1.
 — *Pommeri Eschei.* A garden hybrid. 1892. Gfl. t. 1370, fig. 2.

Phyllocladus. Syn., *Thalamia*.

Piara'nthus.

- P. pili'ferus.* A synonym of *Trichocaulon pili-ferum*.

Pilea.

- P. involucreta.* Green. October. St. Vincent, W. Indies. 1823. Syn., *Urtica involucreta*. B. M. t. 2481.
 — *reticulata.* Red, yellow. August. Jamaica. 1793. Syn., *Urtica reticulata*. B. M. t. 2567.

Pina'nga. See also *Seaforthia*.

Pleurotha'llis.

- P. teretifolia.* Brown. Brazil. 1892.

Podachæ'nium.

- P. andinum.* White, yellow. Columbia. 1892. Rev. Hort. 1892, p. 414, figs. 125-6.

Podaly'ria.

- P. capensis.* See *Virgilia capensis*.
 — *tupinoides.* See *Thermopsis lanceolata*.

Podocarpus.

- P. pectinatus.* Leaves silvery. New Caledonia. 1892.

Polemonium.

- P. cœruleum campanulatum.* Bright lilac-blue. April. N. Europe. 1892

Poly'gonum.

- P. orientale variegatum.* A garden variety with variegated leaves. Rev. Hort., 1892, p. 37, fig. 8.

Poterium. Syn., *Sanguisorba*.

Po'thos.

- P. cannaefolium.* B. M. t. 603. See *Spathi-phyllum cannaefolium*.

Pri'mula.

P. finna'rchica. Dark lilac. Summer. Lapland. 1892.

Prismatoca'rpus.

P. panicula'tus. See *Roella pedunculata*.

Prosa'rtes.

P. lanugin'o'sus. 1½. Yellow, green. June. N. America. 1812. Syns., *Streptopus lanuginosus* and *Uvularia lanuginosa*. B. M. t. 1490.

Pro'tea.

P. imbrica'ta, Andr. Rep. t. 517, is a synonym of *Sorocephalus imbricatus*, not of *Leuca-dendron buxifolium* as stated on p. 801.

Pru'nus.

P. pro'cox. A garden seedling. Rev. Hort. 1892, p. 488, figs. 142-3.
— *Salze'ri*. Fruit yellowish-white. Carinthia. 1892.

Pte'ris.

P. crista'ta. G. C. 1892, xii. p. 249.
— *Regi'næ*. G. C. 1892, xii. p. 249.
— *tre'mula varia'ga'ta*. G. C. 1892, xii. p. 249.

Ptychora'phis.

P. augu'sta. 10. Nicobar Islands. G. C. 1892, xii. p. 397, fig. 63.

Pultenæ'a.

P. euchi'ta. 2. Yellow. May. N. S. Wales. 1824. Syn., *Spadostyles Sieberi*.

Q.

Que'rcus.

Q. macedo'nica. G. C. 1892, xii. p. 669.
— *Schochia'na*. A hybrid between *Q. Phellos* and *Q. palustris*.

R.

Ranu'nculus.

R. carpa'thicus. 1. Golden-yellow. May. E. Hungary. 1892. B. M. t. 7266.

Rhi'psalis.

R. aculea'ta. Whitish. Argentina. 1892. Rev. Hort. 1892, p. 428.
— *a'niceps*. Yellowish-white. Brazil. 1892. Syn., *Lepismium anceps*.
— *capillifo'rmis*. White. Brazil. 1892.
— *clava'ta*. White. Brazil. 1892.
— *comore'nsis*. Greenish-white. Comoro Islands. 1892.
— *dissi'milis setulo'sa*. Brazil. 1892. Syn., *R. setulosa*.
— *gibbe'rule*. White. Brazil. 1892.
— *gonoca'rupa*. White. Brazil. 1892. Syn., *R. pterocarpa*.
— *madagascarie'nsis*. Greenish. Madagascar. 1892.
— *salicornio'des bambuso'des*. Orange or red-dish. Brazil. 1892.
— *suarezia'na*. Diego Suarez. 1892.
— *tetra'gona*. A dwarf species. 1892.
— *tucumane'nsis*. White, rosy. Argentina. 1892.
— *virga'ta*. White. Brazil. 1892.
— *Warmingia'na*. White. Brazil. Gf. 1892, p. 8, figs. 5-7.
— *zanziba'rica*. Zanzibar. 1892.

Rhodode'ndron.

R. Lusco'mbei. Garden hybrid. 1880. G. C. 1892, xi. p. 780.

R. racemo'sum. Rose, white. Yunnan. 1892. Gard. xiii. p. 820, t. 878.

Richa'rdia.

R. aura'ta. Spathes yellow. 1892.
— *Pentla'ndi*. Spathes rich yellow. S. Africa. 1892. Syn., *Calla Pentlandi*.

Robi'nia.

R. neo-mexica'na luxu'rians. June and August. Colorado and Southern Rocky Mountains. 1892.

Rodrigue'zia.

R. Linde'ni. A synonym of *R. pubescens*.

Ro'sa.

R. glutino'sa yarmale'nsis. 2½. Pale red. Mountains near Smyrna. 1892.

Ru'bus.

R. ca'ssius turkesta'nica. Turkestan. Gf. 1892, p. 106, fig. 25.
— *Miltepar'ghi*. A bramble destitute of spines. N. America. 1892.
— *xanthoca'rpus*. 1. White; fruit yellow. N. China. 1892. Syn., *R. Potanini*.

S.

Sa'pium.

S. sebi'ferum. 10. Yellow. China. 1703. Syn., *Stillingia sebifera*.

Sarcochi'lus.

S. Berkelei'yi. Syn., *Thriasperrum Berkeleyi*.
— *bornee'nsis*. Yellowish. Borneo. 1892. Ill. Hort. new ser. t. 161.
— *Sillemia'num*. Syn., *Thriasperrum Sillemia-num*.

Saxi'fraga.

S. Macnabia'na. A garden hybrid. G. C. 1893, xiv. p. 299.

Scabio'sa.

S. Correvonia'na. ¾. Pale yellow. May. Ab-chasia. 1892.

Schizoco'don.

S. soldanolo'des. ½. Deep rose to bluish white. April. Japan. 1892.

Sci'lla.

S. bipart'i'ta. Blue. Winter. Morocco. 1892.

Semperv'vum.

S. Thomey'eri. A garden hybrid. 1892.

Senec'io.

S. Galpi'ni. 1. Bright orange. Transvaal. 1892. B. M. t. 7239.
— *sagittifo'lus*. 10. White, yellow. Uruguay. Rev. Hort. 1892, p. 53, figs. 16-17.

Smilaci'na. Syn., *Tovaria*.

S. olera'cea. 4. White. Sikkim. 1877. Syn., *Tovaria oleracea*.

Smi'lax.

S. argy'rea. Leaves spotted with white. Bolivia. 1892. Ill. Hort. new ser. t. 152.

Sobole'wskya.

S. clava'ta. White. May. Armenia. 1892.

Sobra'lia.

S. Beyeria'na. 1½. White, rosy-pink; lip rosy-lilac, white. 1892.
— *Lucasia'na*. White, lilac; lip rosy-lilac, yellow. 1892.

Sola'num.

- S. corona'tum.* 3. Leaves dark green; prickles violet and grey. 1892.
— *dublosumma'tum.* Blue; fruit white. Abyssinia. Wien. Gart. 1872, p. 472, fig. 79.

Sopbroca'ttleya.

- S. Ve'i'tchii.* Garden hybrid between *Laelio-Cattleya elegans* and *Sophranitis grandiflora.* 1892.

Spathoglo'ttis.

- S. Viella'rdui ru'bra.* A dark-coloured variety. Journ. of Hort. 1892, xxv. p. 529, fig. 70.

Sphæro'gyne.

- S. latifo'lia.* See *Tococa latifolia.*

Stanho'pea.

- S. Molia'na.* Yellowish, white, purple. Peru. 1892. Lind. t. 331.

Sta'tice. Syn., *Taxanthema.***Stauro'psis.**

- S. Warocqua'na.* Yellow, reddish-brown; lip white with rosy spots. New Guinea. 1892. Lind. t. 319.

Stena'ndrium.

- S. Beekmania'num.* Garden hybrid. 1892. Ill. Hort. new ser. t. 166.

Stereospe'rum.

- S. chelono'i des.* Syn., *Bignonia chelonoides.*
— *hyposti'ctum.* 20. Yellow. E. Indies. 1828. Syn., *Bignonia amœna.*
— *serra'tulum.* E. Indies. 1832. Syn., *Bignonia serratula.*
— *suave'olens.* 30. White. E. Indies. 1829. Syn., *Bignonia suberosa.*
— *xyloca'rpum.* White. W. Indies. 1820. Syn., *Tecoma xylocarpa.*

Synandropa'dix.

- S. vermilo'xicus.* 1. Greyish-green, flesh-colour. Tuckman. 1892. B. M. t. 7242.

T.

Tacso'nia.

- T. Smythia'na.* A hybrid or seedling. G. C. 1892, xii. pp. 442 and 794, fig. 109.

Tali'num.

- T. ro'seum.* Rose. Abyssinia. 1892.

Tchihatche'wia.

- T. isati'cea.* Bright rosy-pink. May. Armenia. 1892.

Thali'ctrum.

- T. rhynocœa'rpum.* 3. Summer. Transvaal. 1892.

Thunbe'rgia.

- T. grandiflo'ra c'iba.* Pure white. 1892.

Tilla'ndsia.

- T. Massangea'na.* Leaves barred with bronze. 1892.
— *Moënsii.* Leaves yellowish-green, barred with pale green. 1892.

Tradesca'ntia.

- T. de'cora.* Leaves olive green, with a band of silvery grey. Brazil. 1892.
— *Regi'nœ.* Leaves whitish-green, marked with dark green and purple. Peru. 1892. Ill. Hort. new ser. t. 147.

- T. supe'ra.* Leaves dark green, striped with white, purple beneath. Peru. 1892. Ill. Hort. new ser. t. 155.

Trichode'sma.

- T. physalo'i des.* Pure white; calyx purple. S. Africa. G. C. 1892, xi. p. 363, fig. 51.

Trichopi'lia.

- T. bre'vis.* Yellow, reddish-brown, white. Peru. 1892. Ill. Hort. new ser. t. 332.

Tu'lipa.

- T. Billietia'na.* Lemon-yellow, tinged with red. May. Upper Savoy. B. M. t. 7253.

U.

Urope'talum.

- U. Beazzea'num.* $\frac{1}{2}$. Green. Abyssinia. Gf. 1892, p. 611, fig. 127.

Utricula'ria.

- U. Humboldtii.* $\frac{1}{2}$. Pale lavender. British Guiana. 1892.
— *longifo'lia.* Manve. British Guiana. 1892.

V.

Va'nda.

- V. Arbuthnotia'na.* Golden-yellow, striped with purple. Malabar. 1892.
— *te'res a'iba.* Pure white. 1892.
— *vitelli'na.* Egg-yellow. 1892.

Verno'nia.

- V. podocoma.* 3. Rose purple. S. Africa. 1892. B. M. t. 7255.

Veronica.

- V. monticola.* Blue. Summer. Abyssinia. 1892.

Vi'ola.

- V. declina'ta.* $\frac{1}{2}$. Bright purple, with a yellow eye. May. Transylvania. 1892.

Vrie'sia.

- V. obli'qua.* Garden hybrid. 1892. Gf. t. 1369.
— *tessela'ta Sanderia'na.* A variety with the leaves more distinctly zoned and marbled. 1892.

W.

Warscewicze'lla.

- W. Lindeni.* See *Zygopetalum Lindeni.*

Y.

Yu'cca.

- Y. Hanburyi.* $1\frac{1}{2}$. White. N. America. 1892.

Z.

Zelko'va.

- Z. japonica Verscha'ffelti.* G. C. 1892, xii. p. 669.

Zygope'talum.

- Z. graminifo'lum.* Green, purple. 1892. Lind. t. 340.
— *leucochi'tum.* Garden hybrid. 1892.
— *Linde'ni.* White; lip veined with rosy-purple. 1892. Lind. t. 337. Syn., *Warscewicze'lla Lindeni.*

LIST OF WORDS,

WITH THEIR MEANINGS, MOST FREQUENTLY USED AS SPECIFIC NAMES.

N.B.—Words used chiefly as prefixes or suffixes are marked thus:—*oxy-*, *-anthus*. Adjectives ending in *-us* have *-a* and *-um* as the feminine and neuter terminations respectively; those ending in *-is* take *-is* and *-e*. Only the masculine forms have been given below, unless the other genders contain differences additional to those just mentioned, *e.g.*, *acer*, *campester*, etc. Substantives used as specific names are rarely given in this list. Words derived from the names of persons or places, which are generally self-explanatory, are omitted, except in a few cases.

ABB

abbrevia'tus, shortened.
aborti'vus, abortive.
abru'ptus, torn off, abrupt.
absci'ssus, cut off.
acanthifo'lius, prickly-leaved.
acau'lis, stemless.
acce'dens, approaching.
a'cer, *-cris*, *-cre*, sharp, pungent.
ace'rbus, sour.
acro'cladon, branched at the top.
aculea'tus, furnished with prickles.
acumina'tus, sharply pointed.
acu'tus, pointed. In combination *acuti-*.
admira'bilis, wonderful, astonishing.
adna'scens, growing to or upon.
adna'tus, united to.
adpre'ssus, pressed on.
adsce'ndens, ascending.
adspe'rsus, bestrewed.
adsu'rgens, rising up.
adulteri'nus, adulterous, not genuine.
adumbra'tus, counterfeit.
adu'ncus, curved inwards.
a'dvena, a stranger.
a'ger, *-ra*, *-rum*, sick, unwell.
a'mulus, rivalling, vying with.
aqua'lis, equal.
equinoctia'lis, relating to the equinox.
estiva'lis, } relating to summer.
esti'vus, }
a'stuans, hot, in great commotion.
affi'nis, neighbouring, related.
aggrega'tus, joined with.
agni'nus, relating to a lamb.
agre'stis, field, rustic.
ala'tus, winged.
albe'llus, whitish.

AMP

albe'scens, becoming white.
albicans, white.
albicau'lis, white-stemmed.
albidus, whitish.
albiflo'rus, white-flowered.
albispi'nus, white-spined.
albive'nus, white-veined.
alboct'netus, surrounded with white.
alboosti'pes, white-stalked.
a'lbus, white.
alcico'rnis, elk's-horn.
algidus, cold.
alie'nus, not related.
allia'ceus, garlic-like.
allophy'llus, with leaves of another kind.
aloi'des, aloe-like.
alpe'stris, mountain.
alpi'nus, alpine.
*alte'rnan*s, alternating.
alti'ssimus, highest.
ama'bilis, amiable, lovable.
amarican'lis, bitter stemmed.
amaru's, bitter in taste.
ambi'guus, of doubtful nature.
amethysti'nus, amethyst-coloured.
amethystoglo'ssa, with an amethyst-coloured tongue (or lip).
ame'nus, pleasant, delightful.
amo'rpha, shapeless.
amphi'bium, amphibious, living under two conditions.
amphora'tus, pitcher-like.
amplexica'lis, sheathing the stem.
amplexifo'lius, with sheathing leaves.
a'mplus, large, spacious.
ampulla'ceus, bottle-shaped.

anaca'ntha, without spines.
a'niceps, two-headed.
ancilla'ris, relating to a maidservant.
anfractu'sus, bending.
angui'neus, pertaining to a snake.
angula'ris, } angular.
angula'tus, }
angulo'sus, full of corners.
angusta'tus, narrow.
angustifo'rus, with narrow flowers.
angustifo'lius, narrow-leaved.
angustilo'bus, with narrow lobes.
angu'stior, narrower.
angusti'ssimus, very narrow.
angu'stus, narrow.
anno'sus, long-lived.
anno'tinus, a year old.
annula'ris, } furnished with rings.
annula'tus, }
a'nnuus, annual.
-anthus or *-anthos*, -flowered, e.g.,
brachyanthus, short-flowered.
anti'cus, forward, in front.
anti'quus, ancient.
ape'rtus, uncovered, exposed.
ape'tala, without petals.
aphy'llus, without leaves.
apicula'tus, furnished with a point.
apo'da, without a foot.
appendicula'tus, bearing an appendage.
applana'tus, flattened out.
appla'ca'tus, applied to, lying near.
appre'ssus. See *adpressus*.
a'ptera, wingless.
aqua'ticus, } living in water.
aqua'tilis, }
a'queus, watery.
aquili'nus, relating to an eagle, eagle-
 like.
arachni'tis, cobwebby.
arachnoi'des, spider-like.
arbore'scens, } tree-like.
arbo'reus, }
arcua'tus, bow-shaped.
a'rdens, fiery.
areno'sus, sandy.
areola'tus, furnished with small open
 spaces.
argu'tus, acute, sharp.
a'ridus, dry.
arista'tus, furnished with a point (from
arista, the point of an ear of corn).
arma'tus, armed.
armilla'ris, } adorned with an armilla
armilla'tus, } or collar.
aroma'ticus, aromatic.
arre'ctus, steep.
articula'tus, jointed.
arundina'ceus, reed-like.
arve'nsis, pertaining to a corn-field.
a'sper-, *-era*-, *-erum*, rough.
aspera'tus, roughish.
aspe'rri'mus, very rough.
aspe'rsus, scattered, bestrewed.

asplenifo'lius, with leaves resembling an
Asplenium.
assi'milis, similar.
assu'rgens, standing or rising up.
a'ter-, *-tra*-, *-trum*, black.
atra'tus, clothed in black.
atro-, black-
attenua'tus, attenuate.
augu'stus, majestic.
au'licus, princely.
auranti'acus, orange-coloured.
aura'tus, } golden.
au'reus, }
auri'comus, golden-haired.
auri'tus, long-eared.
austra'lis, southern.
autumna'lis, autumnal.
avena'ceus, oaten.
avicula'ris, pertaining to a small bird.
axilla'ris, axillary.
axillifo'rus, with the flowers axillary.
azu'reus, azure-blue.

B.

bacca'tus, berried. Originally meaning
 set with pearls.
bacci'ferus, bearing berries.
baculi'ferus, bearing small twigs.
ba'dius, chestnut-coloured.
balsa'micus, } balsam-bearing.
balsami'ferus, }
barba'tulus, with a small beard.
barba'tus, bearded.
basila'ris, basal.
begonia'fo'lius, with leaves like a Begonia.
be'llus, pretty.
benedi'ctus, praised.
berberifo'lius, with leaves like a Ber-
 beris.
beta'ceus, Beet-like.
bi-, two-
biarticula'tus, two-jointed.
bi'color, two-coloured.
bie'nnis, of two years.
bipinna'tus, twice pinnate.
bipinnati'fidus, twice pinnatifid.
bise'ctus, cut into two parts.
bitumino'sus, pitchy.
bla'ndus, pleasant, flattering.
bo'nus, good.
borea'lis, northern.
botryoi'des, bearing bunches like grapes.
brachia'tus, provided with arms.
brachy-, short-, e.g., *brachyphyllus*,
 short-leaved.
brachya'ndra, with short stamens.
bractea'tus, furnished with bracts.
bracteola'tus, furnished with bracteoles.
bre'vis, short, e.g., *brevifolius*, short-
 leaved.
brillianti'ssimus, very or most brilliant.
bruma'lis, relating to the shortest day.
bryoi'des, moss-like.

bubuli'nus, relating to an ox.
bufo'nus, relating to a toad.
bulbi'ferus, bearing bulbs.
bulbo'sus, furnished with a bulb, swollen.
bullat'us, transitory. Most frequently used in the sense of having the appearance of being covered with bubbles (*bullæ*, a bubble).
bullula'tus, covered with small bubbles.
butyra'ceus, butter-yielding.
buxifo'lus, box-leaved.
byzanti'nus, Turkish.

C.

cæru'leus, dark-blue. Also spelt *cæruleus*.
cærule'scens, becoming dark-blue.
cæsius, bluish-grey.
cæspito'sus, tufted, turfey.
calcara'tus, spurred.
calo- (Greek, *kalos*), beautiful.
calo'coma, beautiful-haired.
caloglo'ssa, beautiful-tongued.
calome'lanos, beautiful black.
calo'pterum, beautiful-winged.
calo'thrice, beautiful-haired.
calve'scens, to become bald, or to grow up thinly.
calyci'nus, furnished with a calyx or cup.
calycula'tus, furnished with a small calyx.
ca'mbricus, Welsh.
campanula'tus, bell-shaped.
campanulifo'rus, with bell-shaped flowers.
campester, -*tris*, -*tre*, relating to plains.
campy, curved-. (Greek, *kampulos*.)
campyla'cantha, with curved spines.
canalscula'tus, channeled.
cancellat'us, latticed.
ca'ndicans, becoming white.
candidi'ssimus, very white and shining.
ca'ndidus, shining white.
cane'scens, hoary.
cani'nus, pertaining to dogs.
ca'nus, whitish-grey.
cape'nsis, cape, usually, when applied to plants, referring to the Cape of Good Hope.
capilla'ceus, } hair-like, capillary.
capilla'ris, }
capita'tus, furnished with a head.
capitella'tus, furnished with a little head.
capreola'tus, pertaining to a goat.
capsula'ris, furnished with a capsule.
cardinal'is, red (rarely used in botany for jointed).
cardua'ceus, thistle-like.
carico'sus, sedgy.
carina'tus, keeled.
caris'simus, most esteemed.

ca'rneus, } fleshy, flesh-coloured.
carno'sus, }
cartilagi'neus, horny.
ca'strus, spotless, chaste.
cathar'ticus, purging.
cauda'tus, tailed.
caule'scens, } stemmed.
-cau'lis, }
ca'vus, hollow.
centi, hundred-. (Latin, *centum*.)
cephal-, a head. (Greek, *kephale*.)
cera'micus, pertaining to pottery.
cerasifo'rnis, cherry-shaped.
ceri'ferus, wax-bearing.
ce'rnuus, inclined, nodding.
cervi'nus, pertaining to a stag.
cheil-, lip-. (Greek, *cheilos*.)
cheir-, hand-. (Greek, *cheir*.)
chlor-, pale green. (Greek, *chlōros*.)
chrys-, golden-. (Greek, *chrusos*.)
ciba'rius, relating to food.
cilia'ris, } furnished with hairs like eye-
ilia'tus, } lashes.
ci'nectus, surrounded.
cine'reus, ashy.
cinnabari'nus, cinnabar, vermilion.
cinnamo'meus, cinnamon-like.
circina'tus, curled up like the head of a crosier.
circum-, around.
circumci'ssus, cut around.
cirrho'tus, or *cirrho'sus*, furnished with cirrhi or curls.
cirrho'ferus, bearing cirrhi.
citri'nus, yellow.
clandest'i'nus, secret, concealed.
clari'ssimus, most brilliant.
clava'tus, club-shaped.
clypeat'us, shield-like.
coarcta'tus, confined.
cocci'neus, scarlet.
cochlea'ris, } snail-shaped, spiral.
cochlea'tus, }
coe'lestis, heavenly.
cæru'leus, dark-blue. Sometimes spelt *cæruleus*.
coll'i'nus, hilly.
col'o'rans, colouring.
colora'tus, coloured.
col'o'sseus, gigantic.
columella'ris, pillar-shaped.
columna'ris, columnar.
co'mans, } hairy.
coma'tus, }
commu'nis, common, social.
commuta'tus, changed.
com'o'sus, hairy.
compa'ctus, compact.
complana'tus, flattened out, levelled.
comple'xus, encompassed.
complica'tus, folded together.
compo'situs, compound.
compre'ssus, compressed.
co'mptus, adorned.

conca'vus, concave.
conch-, shell. (Latin, *concha*.)
conchifo'rmis, shell or horn-shaped.
conci'nus, neat, elegant.
co'ncolor, similar in colour, of the same colour.
condensa'tus, condensed.
confe'rtus, compressed, dense.
conge'stus, brought together, congested.
conglomera'tus, heaped together.
co'nicus, conical.
consolida'tus, thickened, consolidated.
conspi'cuus, visible, striking, conspicuous.
constri'ctus, constricted.
contamina'tus, defiled.
conti'guus, near.
contor'tus, twisted.
contra'ctus, contracted.
copio'sus, abundant.
corda'tus, heart-shaped.
cordifo'lius, with heart-shaped leaves.
cornicula'tus, horned, shaped like the new moon.
cornu'tus, horned.
coro'nans, crowning.
corona'tus, crowned.
corruga'tus, wrinkled.
cortica'tus or *cortico'sus*, furnished with bark.
coru'scans, flashing, trembling.
corymbo'sus, corymb-like.
costa'tus, furnished with a midrib.
crassicau'lis, thick-stemmed.
crassifo'lius, thick-leaved.
crassine'rvius, thick-nerved.
cra'ssus, thick.
crena'tus, scalloped, crenate.
crenula'tus, crenulate.
cre'pitans, crackling.
crini'tus, with stiff hairs.
cri'spus, curled.
crista'tus, crested.
croca'tus, } saffron-yellow.
cro'ceus, }
crucia'tus, cross-shaped.
crue'ntus, bloody.
crypt-, concealed-, secret-. (Greek, *krup-tos*.)
crystalli'nus, crystalline.
cuccula'tus, hooded.
cultra'tus, knife-shaped.
cunea'tus, wedge-shaped.
cu'preus, copper-coloured.
cu'rtus, short.
curva'tus, curved.
cuspidata'tus, furnished with a cusp or point.
cyaneus, dark blue.
cyanospe'rma, blue seeded.
cylindricus, cylindrical.
cymbifo'rmis, boat-shaped.
cymo'sus, cyme-like.

dasy-, thick with hair, hairy. (Greek, *dasus*.)
dasya'ntha, hairy-flowered.
dasyca'rpum, hairy-fruited.
dasyphy'llus, hairy-leaved.
dealba'tus, white-washed.
de'bilis, weak.
deca'ndra, with ten stamens.
deci'duus, deciduous, falling down.
deci'piens, deceptive.
declina'tus, bent aside.
decolo'rans, discoloured.
decompo'situs, decomposed, much divided.
deco'rus, becoming.
decu'mbens, lying down.
decu'rrens, passing down quickly. In botany generally used in the sense of passing down and adhering to, e.g., the decurrent leaves of *Symphytum officinale*.
decussa'tus, intersecting.
defi'ciens, vanishing, deficient.
defi'xus, fixed into.
defle'xus, bent down.
defo'rmis, deformed, misshapen.
dehi'scens, splitting.
delica'tus, charming, tender.
demi'ssus, lowered, thrust down.
de'ns-ca'nis, dog's tooth.
de'nsus, thick, dense.
denta'tus, toothed.
denticula'tus, with small teeth.
dennuda'tus, uncovered.
depaupera'tus, poor.
depe'ndens, hanging down.
depre'ssus, pressed down.
desci'scens, withdrawing from.
deu'stus, hurried down.
diaca'ntha, with two spines.
dia'ndra, with two stamens.
diapha'nus, translucent.
dicho'tomus, twice forked.
didi'sticha, two ranked.
di'dymus, twin.
diffo'rmis, deformed.
diffu'sus, spread about, diffuse.
digita'tus, spread out like fingers
dilata'tus, dilated.
dimidia'tus, halved, divided.
dimo'rphus, of two forms.
dioi'cus, diocious.
di'scolor, particoloured.
dispar, -*aris*, unequal.
disse'ctus, cut apart, dissected.
dissi'milis, unlike.
di'stichus, in two rows.
diu'rnus, daily.
divarica'tus, stretched apart.
diversifo'lius, with leaves of different kinds.
di'ves, rich, fruitful.
divi'sus, divided.
dolabrifo'rmis, hatchet-shaped.

dolo'sus, crafty.
dome'sticus, belonging to the house,
 domestic.
drupa'ceus, fruit, a drupe. (Latin, *drupa*,
 an over-ripe olive.)
drupi'ferus, bearing drupes.
dry'ades, pertaining to woods. (Latin,
Dryas, a wood nymph.)
du'bius, doubtful.
du'lcis, sweet.
dumo'sus, bushy, brambly.
du'plex, double.
du'rus, hard.

E.

e-, without-
ebena'ceus, like ebony.
ebractea'tus, without bracts.
ebu'rneus, like ivory.
echina'tus, spiny, prickly.
ecornu'tus, without horns.
edenta'tus, without teeth.
edu'lis, edible.
ela'sticus, elastic.
ela'tior, higher.
ela'tus, high, elevated.
e'legans, elegant.
elli'pticus, elliptical, oval.
elonga'tus, lengthened.
eme'ticus, emetic.
e'minens, prominent, distinguished.
ensifo'rmis, sword-shaped.
equ'e'ster, -*tris*, -*tre*, pertaining to horses,
 equestrian.
cre'ctus, erect.
ero'sus, gnawed away.
erube'scens, becoming red.
erythro-, red-. (Greek, *eruthrōs*.)
erythroca'rupus, red-fruited.
escule'ntus, edible.
etubero'sus, destitute of tubers.
eu-, well, beautiful, *e.g.*, *euglossa*, with
 a beautiful tongue.
exalta'tus, raised up, elevated.
exce'lsus, lofty, sublime.
exse'rtus, stretched out, exerted.
exu'dans, overflowing, exuding.
exuvia'tus, peeling off.

F.

falca'tus, scythe-shaped.
fa'llax, false, deceitful.
farino'sus, mealy, floury.
fascicula'tus, arranged in bundles.
fastigia'tus, sharpened to a point.
fe'lix, fertile, happy.
fenestra'lis, furnished with windows or
 openings.
fe'rox, wild, fierce.
fe'rreus, like iron, hence hard.
ferrugi'neus, colour of iron rust.
fibro'sus, fibry.
ficoi'deus, fig-like.

filament'o'sus, furnished with filaments,
 thready.
filicau'lis, with a thread-like stem.
filici'nus, fern-like.
fil'i'ferus, bearing threads.
fi'rmus, firm, strong, durable.
fi'ssus, split, cloven.
fiabella'tus, fan-shaped.
fla'ccidus, weak, flabby.
flagella'tus, whip-bearing.
fla'mmeus, flame-coloured, fiery red.
fla'vus, yellow.
fle'xilis, flexible.
flexo'sus, crooked.
focco'sus, woolly.
flo're a'lbo, with white flower.
flo're ple'no, with double flower (literally,
 with full flower).
flo'ridus, flowery, flourishing.
flo'rus, -flowered.
flu'itans, flowing.
fluvia'tilis, belonging to a river.
fœ'tidus, fœtid, stinking.
folio'sus, leafy.
fo'lius, -leaved.
fonta'nus, } belonging to a spring.
fontina'lis, }
fovea'tus, furnished with small pits.
fra'gilis, fragile, easily broken.
fra'grans, fragrant.
fragranti'ssimus, very fragrant.
fraxi'neus, pertaining to the Ash.
fr'i'gidus, cold, frosty.
frondo'sus, leafy.
fru'ctu a'lbo, with white fruit.
frute'scens, becoming bushy.
frutico'sus, bushy.
fuca'tus, painted, counterfeit.
fucifo'rmis, sea-weed like.
fu'gax, transitory.
fu'lgens, } gleaming, shining.
fu'lgidus, }
fuligino'sus, sooty.
fu'lvus, tawny.
funa'lis, relating to a rope.
fun'e'bris, funereal.
fun'e'stus, deadly, destructive.
fungo'sus, spongy, fungoid.
furca'tus, forked.
furfura'ceus, scurfy.
fu'sco-vi'ridis, dark green.
fu'scus, dark-coloured.
fusifo'rmis, spindle-shaped.

G.

-gaster, -bellied, *e.g.*, *stenogaster*, with a
 narrow belly.
ge'lidus, cold, icy.
gema'ntus, in pairs, twin.
gemma'tus, bearing buds.
genicula'tus, jointed like a knee, knotty.
gi'bbus, swollen, having humps.
giga'nteus, gigantic.

gi'gas, a giant.
glabe'llus, rather smooth.
glaber, -*bra*, -*brum*, smooth. Used in the sense of being destitute of hairs.
glabe'rrimus, very smooth.
glabriu'soulus, rather smooth.
glanduli'ferus,
glanduli'gerus, } bearing glands.
glandulo'sus, glandular.
glauce'scens, becoming bluish-grey.
glau'cus, bluish-grey, glaucous.
globi'ferus, ball-bearing.
globo'sus, globular.
glomera'tus, heaped into a spherical mass.
glorio'sus, glorious.
gluma'ceus, husky.
glutino'sus, sticky.
gongylo'des, rounded.
gra'cilis,
gracile'ntus, } slender.
graci'llima, very slender.
grami'neus, grassy.
gra'ndi-, large-.
gra'ndis, large.
granula'tus,
granulo'sus, } granular.
gratio'sus, favoured.
grati'ssimus, most favoured.
gra'tus, pleasant.
gra'veolens, strong-smelling, fœtid.
grossila'bris, large-lipped.
gu'mmi'fer,
gummi'ferus, } gum-bearing.
gutta'tus, speckled, spotted.
guttula'tus, with small spots.
gymn-, naked-. (Greek, *gymnas*.)
gyn-, female-. (Greek, *gune*, a woman.)
gy'rans, revolving.

H.

hæm-, blood-. (Greek, *haima*, blood.)
hama'tus, curved like a hook.
hasta'tus, armed as with spears.
hasti'lis, spear-shaped.
hedera'ceus, ivy-like.
helianthoi'des, resembling the sun-flower.
hemispha'ricus, hemispherical.
herba'ceus, herbaceous.
heteraca'ntha, having spines of different sorts.
hetera'ndrum, having stamens of different sorts.
heteroca'rpum, having fruit of different sorts.
hex-, six-.
hi'ans, gaping.
hiema'lis, wintery.
hiri'cus, relating to a he-goat.
hirsu'tulus, having short stiff hairs.
hirsu'tus, having stiff hairs.
hi'rtus, shaggy.
hispidi'ssimus, densely covered with stiff hairs.

histro'nicus, relating to actors.
holo-, wholly-. (Greek, *holos*.)
homo-, resembling-. (Greek, *homoios*.)
horizonta'lis, horizontal.
ho'rridus, shaggy, bristly, frightful, harsh.
horte'nsia, garden plants.
horte'nsis, relating to a garden.
hu'milis, little, humble.
hya'linus, glassy, transparent.
hyberna'lis, resting during winter.
hyema'lis, wintery.
hyper-, over, above. (Greek, *hyper*.)
hyperbo'reus, northern.
hypo-, under, beneath. (Greek, *hupo*.)
hypocraterifo'rmiis, salver-shaped.
hy'strix, a porcupine.

I.

ia'nthina, violet.
icosa'ndra, having twenty stamens.
i'gneus, fiery, glowing (applied to colours).
illu'stris, brilliant, renowned.
imbe'rbiis, beardless.
imbrica'tus, overlapping like tiles.
immacula'tus, unspotted.
imme'rsus, immersed.
imperia'lis, powerful, imperial.
imple'xus, interwoven.
impre'ssus, impressed, stamped.
inequa'lis, unequal.
inape'rtus, closed.
inca'nus, grey.
incarna'tus, flesh-colour.
inci'sus, divided, cut.
inclina'tus, bent, inclined.
incompara'bilis, incomparable.
inco'mptus, rough, inelegant.
inconspi'cuus, inconspicuous.
incurva'tus, curved inwards.
indivi'sus, not divided.
ine'rmis, unarmed.
infla'tus, swollen.
infra'ctus, broken.
inodo'rus, without smell.
i'nquinans, contaminating.
insi'gnis, remarkable.
integer, -*gra*, -*grum*, entire.
intege'rrius, quite entire.
interru'ptus, broken asunder, interrupted.
interte'xtus, interwoven.
intum'e'scens, swelling up.
invi'sus, unseen, secret; also hateful, hostile.
involucra'tus, furnished with an involucre.
involu'tus, rolled inwards.
iona'ntha, violet-flowered.
iride'scens, shining with varied colours.
irri'guus, well watered.
irrosa'tus, moistened, bedewed.
iso-, equal-. (Greek, *isos*.)

juba'tus, crested, having a mane.
jucu'ndus, pleasing.
juga'tus, yoked together.
jugo'sus, mountainous.
ru'nceus, rush-like.
juve'nilis, youthful.

L.

labia'tus, lipped.
labro'sus, having a wide lip.
la'cerans, lacerating.
lacinia'tus, cut in a fringe-like manner.
la'crymans, weeping.
la'cteus, milky.
lacuno'sus, full of holes.
laci'stris, pertaining to a lake or pool.
late-vi'rens, of a cheerful green colour.
laeviga'tus, smooth, polished.
la'vis, on the left hand. See also *levis*.
lamella'tus, divided into plates or lamellæ.
lana'tus, woolly.
lanceola'tus, lanceolate, spear-shaped.
lanugino'sus, woolly, downy.
la'tus, *lati-*, broad.
la'xus, *laxi-*, wide, loose.
leiocarpus, smooth-fruited.
lenticula'ris, lentil-shaped.
lentigino'sus, freckly.
le'ntus, tough.
lepido'tus, covered with scales.
le'pidus, pleasant, neat.
lepro'sus, scurfy.
lepto-, thin-. (Greek, *leptos*.)
leuco-, white-, clear-. (Greek, *leukos*.)
le'vis, light, trifling.
le'vis, smooth, polished, often erroneously written *la'vis*.
ligno'sus, woody.
lila'cinus, lilac.
limba'tus, bordered.
linea'ris, linear.
li'vidus, lead-colour, bluish-grey.
loba'tus, lobed.
lolia'ceus, relating to tares, weedy.
longe'vus, aged.
lo'ngus, long. In combination, *longi-* or *longe-*.
luna'ris, relating to the moon, moon-like.
lu'ridus, pale yellow, lurid, livid.
lute'scens, becoming yellow.
lu'teus, yellow.
luxa'tus, dislocated.
luxu'rians, luxurious.
lyra'tus, shaped like a lyre.

M.

macile'ntus, thin, lean.
macr- (Greek, *makros*), long-. Often used in botany in the sense of large, e.g., *macrantha*, large-flowered.

magni'ficus, magnificent, distinguished.
maja'lis, May.
mage'sticus, dignified.
ma'jor, -us, greater.
malifo'rmis, apple-shaped.
mallei'ferus, hammer-bearing.
mammo'sus, having large breasts.
manica'tus, having long sleeves.
margarita'ceus, pearly.
margina'lis,
margina'tus, } bordered.
mar'i'nus,
mar'i'timus, } marine.
marmora'tus, like marble.
ma'sculus, male.
matrona'lis, matronly.
maxilla'ris, relating to the jaw.
ma'ximus, largest.
me'dius, middle.
medulla'ris, relating to marrow.
mega-, large-. (Greek, *megas*.)
mei'ror, a lad or lass.
melano-, black-. (Greek, *melas*, *melaina*, *melan*.)
melio'smum, pleasant smelling.
me'lleus, relating to honey.
mellio'smum, smelling like honey.
membrana'ceus, membranous.
meta'llicus, metallic.
mi'cans, glittering.
micro-, small-. (Greek, *mikros*.)
milita'ris, military, soldier-like.
mi'nax, overhanging.
mi'nimus, smallest.
mi'nor, -us, less, smaller.
minuti'ssimus, very minute.
mira'bilis, wonderful.
mi'tis, mild, ripe.
mode'stus, moderate, unassuming.
mo'llis, soft, tender.
mon-, alone-, one-. (Greek, *monos*.)
monta'nus, mountain.
monti'colus, dwelling among the mountains.
macrona'tus, having a sharp point.
mul'tus, much, many. In combination, *multi-*.
muni'tus, secured, fortified.
murica'tus, conical, pointed.
muri'nus, relating to a mouse.
muscoi'des, moss-like.
muta'bilis, changeable.
mu'ticus, curtailed.
myri-, numberless-, infinite-. (Greek, *myrios*.)

N.

na'nus, dwarf.
napifo'rmis, turnip-shaped.
nasu'tus, having a large nose.
na'tans, swimming.
navicula'ris, boat-shaped.
nebulo'sus, cloudy, foggy.
negle'ctus, disregarded.

nemora'lis, } relating to woods, sylvan.
nemoro'sus, }
nervo'sus, sinewy, full of nerves.
ni'ger, -*gra*, -*gram*, black.
ni'gricans, blackish.
ni'tens, } shining, brilliant.
ni'tidus, }
niva'lis, } snowy, white as snow.
ni'veus, }
nivo'sus, abounding in snow, snowy.
noda'tus, knotty.
nodiflo'rus, flowering at the nodes.
nodo'sus, knotty.
nota'tus, known, marked.
nubi'genus, produced from a cloud.
nuci'ferus, bearing nuts.
nu'dus, naked.
nummularia'fo'lia, having leaves shaped like money.
nu'tans, nodding.

O.

obco'nicus, obconical, shape of a reversed cone.
obcorda'tus, shaped of a heart attached by its apex.
obe'sus, fat, corpulent.
obli'guus, oblique, aslant.
oblo'ngus, oblong.
obova'tus, reversed ovate.
obscu'rus, obscure.
obsole'tus, worn out, decayed.
obtu'sus, obtuse. In composition, *obtu-* or *obtusi-*.
obvalla'ris, surrounded with a wall.
occidenta'lis, western.
ocella'tus, spotted as with small eyes.
ochroleu'cus, yellowish-white.
octa'ndra, having eight stamens.
ocula'tus, having eyes, spotted.
odora'tus, odorous, sweet-smelling.
odorati'ssimus, very sweet-smelling.
officina'lis, officinal, pertaining to a shop.
-oides, -like.
o'lens, smelling (generally in the sense of foetid).
o'ligo-, few- (Greek, *oligos*), e.g., *oligo-sperma*, having few seeds.
olito'rus, relating to culinary herbs.
oliva'ceus, relating to the olive.
onu'stus, filled, laden.
opa'cus, shaded, obscure, opaque.
opercula'tus, having a lid.
oppositifo'lius, having opposite leaves.
orbicula'ris, } rounded, orbicular.
orbicula'tus, }
orna'tus, adorned, furnished.
orni'thopus, bird's-foot.
orth-, straight-, erect-. (Greek, *orthos*.)
ostrea'tus, rough like an oyster-shell.
ova'lis, } oval.
ova'tus, }

ovi'ferus, } egg-bearing.
ovi'gerus, }
oxy-, sharp-. (Greek, *oxus*.)

P.

pachy-, thick-. (Greek, *pachus*.)
pa'llens, pale.
palle'scens, becoming pale.
pa'llidus, pale.
paludo'sus, marshy.
palu'ster, -*tris*, -*e*, marshy, boggy. The masculine of this is frequently, though erroneously, written *palustris*.
pandura'tus, fiddle-shaped.
panicola'tus, bearing a tuft or panicle.
panno'sus, ragged, shrivelled.
papillo'sus, bearing small nipples.
papyra'ceus, parchment-like, papery.
parado'xus, strange, unexpected.
parasi'ticus, parasitic.
parti'tus, divided.
pa'rvus, small. In combination, *parvi-*.
patella'ris, dish- or platter-shaped.
pa'tens, } open, patent.
pa'tulus, }
pauci-, few-. (Latin, *paucus*.)
pavoni'nus, variegated in colour like a peacock.
pectina'tus, comb-like.
pectora'lis, relating to the breast.
peda'tus, foot-like.
peduncula'tus, stalked.
pellu'cidus, pellucid.
pelta'tus, armed with shields, shield-like.
pelvifo'rmis, basin-shaped.
pe'ndulus, hanging down, pendulous.
penicilla'tus, tufted like the hairs in a brush.
penni-, arranged like the parts of a feather. (Latin, *penna*, a feather.)
penta-, five-. (Greek, *pente*.)
pentago'nus, with five obtuse angles.
percu'ssus, pierced, struck through.
peregri'nus, foreign, strange.
per'elegans, very pretty, neat.
per'eennis, perennial.
perfo'liatus, run through the leaves.
perpusi'llus, very small.
petiola'ris, having leaf-stalks.
petra'us, rocky.
pha'um, dusky.
phyll-, leaf-. (Greek, *phullon*.)
pictura'tus, } painted.
pi'ctus, }
pilo'sus, hairy, pilose.
pinna'tus, feathered, pinnate.
pla'nus, flat. In combination, *plani-*.
platy-, flat-. (Greek, *platus*.)
ple'nus, full, filled.
pleur-, side-, lateral-. (Greek, *pleura*, a rib or side.)
plica'tus, folded.

pluma'tus, plume-like.
plu'mbeus, leaden.
plumo'sus, feathered.
pod-, foot-. (Greek, *pous*, *podos*.)
poli'tus, polished, refined.
poly-, much- or many-. (Greek, *polus*.)
pomi'ferus, apple-bearing.
po'rrigens, extending.
præ'coæ, premature, precocious.
præmo'rsus, bitten off.
præni'tens, shining forth.
præ'stans, excellent.
pra'sinus, leek-green.
prate'nsis, growing in a meadow.
precato'rius, entreating, referring to seeds used for making rosaries. See under **Abrus**, p. 2.
princeps, chief.
proce'rus, tall, slender.
procu'mbens, falling down.
procu'rrens, running forward.
profu'sus, extravagant, profuse.
propi'nquus, near, related.
pror'e'pens, creeping forth.
prostra'tus, prostrate.
protru'sus, thrust forth.
pru'riens, itching.
pseud-, false-. (Greek, *pseudes*.)
psittaci'nus, parrot-like.
ptero-, winged-. (Greek, *pteron*.)
pu'bens, arrived at full growth, luxuriant.
pube'scens, pubescent, clothed with small hairs.
pulcher, -*chra*, -*chrum*, beautiful, fair.
pulche'rrius, very beautiful.
pu'llus, dark-coloured.
pulverule'ntus, dusty.
pulvina'tus, furnished with small cushions.
pu'milus, dwarf.
puncta'tus, punctured, pricked.
pu'ngens, pricking, stinging.
purpura'scens, becoming purple.
purpu'reus, purple.
pustillus, very small.
pustulo'sus, full of pimples.
pygma'us, dwarf.
pyxida'tus, made like a turned box.

Q.

quadrangula'ris, having four angles.
quadra'tus, square.
quadri-, four-.
quercifo'lius, oak-leaved.
quinque-, five-.

R.

racemo'sus, full of clusters, racemose.
radia'tus, radiating.
radi'cans, rooting.
ramo'sus, branched.

ramosi'ssimus, very much branched.
ramulo'sus, full of little branches.
re'ctus, straight.
recu'rvus, reflexed.
refle'xus, reflexed, bent back.
regi'na, queen.
remo'tus, distant, remote.
renifo'rmis, kidney-shaped.
re'pens, sudden, unexpected.
re'ptans, creeping.
reticula'tus, netted.
retrofle'xus, bent backwards.
retu'sus, thrust back.
revolu'tus, rolled back.
rhiz-, root-. (Greek, *rhiza*.)
rhod-, rosy-. (Greek, *rhodeos*.)
rhombifo'lius, rhomboid-leaved.
ri'gidus, rigid.
ri'ngens, gaping.
ripa'rius, frequenting river banks.
riva'lis, relating to a brook.
robu'stus, strong, robust.
rosa'ceus, pertaining to roses.
ro'seus, rose-coloured.
rostra'tus, having a beak.
rotundifo'lius, round-leaved.
ru'ber, -*bra*, -*brum*, red.
ru'dis, rough, rude.
rufe'scens, becoming red.
ru'fus, ruddy.
rugo'sus, wrinkled.
ru'sticus, rural, rustic.
ru'tilans, shining with ruddy gleam.

S.

sacca'tus, baggy.
sagitta'tus, arrow-like.
sabi'gans, made of willow-wood.
saltato'rius, relating to dancing.
salvica'fo'lius, having leaves like sage.
sa'nctus, sacred.
sangui'neus, } bloody.
sanguinole'ntus, }
sarmento'sus, full of twigs.
sati'vus, cultivated.
saxa'tilis, } frequenting rocks.
saxi'colus, }
sca'ber, -*bra*, -*brum*, rough.
scala'ris, ladder-like.
sca'ndens, climbing.
scario'sus, chaffy.
sce'ptrum, a sceptre, wand.
schiz-, split-. (Greek, *schizo*, to split.)
scilla'ris, squill-like.
sclero-, hard-. (Greek, *skleros*.)
scopuli'nus, pertaining to rocks or cliffs.
scu'ptum, carved.
scuta'tus, armed with a shield.
sebi'ferus, wax-bearing.
secu'ndus, following, second-rate, turned on one side.
semi-, half-.
seni'lis, old, senile.

seta'ceus, }
seti'gerus, } bristly.
seto'sus, }
signatus, marked.
simplex, simple. In combination, *simplici-*
simulans, imitating.
sinuatus, }
sinuosus, } wavy, sinuous.
solaris, relating to the sun, solar.
solidus, solid, compact.
solitarius, solitary.
sordidus, dirty.
sparsus, scattered.
speciosissimus, most handsome.
speciosus, beautiful, handsome.
spectabilis, notable, remarkable.
sphaericus, spherical.
spicatus, bearing spikes (as of corn).
spinosus, spiny.
spiralis, spiral.
splendens, }
splendidus, } brilliant, splendid.
splendidissimus, most brilliant.
spurrius, false, bastard.
squalidus, rough, filthy.
squamatus, }
squamosus, } armed with scales.
stellatus, starry.
stelligerus, star-bearing.
steno-, narrow-. (Greek, *stenos*.)
sterilis, barren, unfruitful.
stipitatus, stalked.
stoloniferus, bearing suckers or stolons.
stramineus, made of straw.
strangulatus, choked.
strept-, twisted-. (Greek, *streptos*.)
striatus, fluted, striate.
strictus, drawn together, close.
strigosus, lean, thin.
suaevolens, sweet-smelling.
suaavis, sweet, pleasant.
sub-, *suf-*, under-, somewhat-; e.g., *sub-*
carneus, somewhat fleshy.
suberosus, somewhat corroded or
 gnawed away.
suberosus, corky.
subterraneus, underground.
subulatus, awl-shaped.
sulcatus, furrowed.
sulphureus, sulphureous, sulphur-co-
 loured.
superbus, proud, magnificent, superb.
suspenus, hanging, elevated.
sylvaticus, }
sylvestris, } pertaining to woods.

T.

tabularis, relating to boards, flat.
tardiflorus, slow- or tardy-flowering.
tectus, covered.
temulentus, intoxicated.
tenebrosus, dark, gloomy.

tener-, *-era*, *-erum*, tender, delicate.
tentaculatus, furnished with tentacles.
tenues, thin, weak.
teres, rounded, cylindrical.
terminalis, terminal.
ternatus, arranged in threes.
terrestris, terrestrial.
tessellatus, tessellated.
tetra-, four-; e.g., *tetragynum*, having
 four pistils.
tetrandra, having four stamens.
thermalis, pertaining to warm springs.
thricospermum, hairy-seeded.
tigrinus, spotted like a tiger.
tinctorius, dyed, relating to dyeing.
tomentosus, covered with matted hair,
 tomentose.
tortilis, }
tortuosus, } twisted.
tortus, }
toxicarius, poisonous.
tremitus, quivering.
tri-, three-. (Latin, *tres*, *tria*.)
trich-, hair-; e.g., *trichoclada*, having
 hair-like branches.
tricolor, of three colours.
trifolius, having three leaflets, tri-
 foliate.
tristis, sorrowful, gloomy.
triumphans, triumphant, exultant.
trivialis, ordinary, trivial.
tropicus, pertaining to the tropics.
tuberculatus, bearing tubercles or small
 tubers.
tuberosus, bearing tubers.
tubiflorus, having tubular flowers.
turbidus, conical, top-shaped.
turgidus, swollen, turgid.
typicus, typical.

U.

uliginosus, damp, marshy.
ulmifolius, having leaves resembling
 those of the elm.
umbellatus, branched like the ribs of a
 parasol.
umbonatus, having protrusions like the
 boss of a shield.
umbraculiferus, shade-yielding.
uncinatus, hooked, barbed.
undulatus, wavy, undulating.
unguiculatus, clawed.
uni-, one- (Latin, *unus*); e.g., *uniflorus*,
 having one flower.
urceolaris, }
urceolatus, } pitcher-shaped.
urens, burning, stinging.
ursinus, relating to a bear.
ustulatus, singeing.
utilis, useful, serviceable.
utilissimus, very useful.
utriculatus, bladderly.
uviferus, grape bearing.

vaci'llans, wavering, tottering.
va'gans, rambling.
vagina'tus, sheathed.
va'lidus, strong, powerful.
varia'bilis, variable.
va'rians, changing.
varico'sus, having varicose veins.
va'rius, manifold, various.
vasta'trix, a devastator.
ve'getus, vigorous.
vela'tus, covered.
velu'tinus, velvety.
veneno'sus, poisonous.
veno'sus, veined.
ventrico'sus, swollen like a belly.
venu'stus, charming, lovely.
verecu'ndus, bashful.
versa'tilis, turning about, versatile.
verna'lis, } pertaining to the spring.
ve'rnus, }
versi'color, of various colours.
verticilla'ris, } arranged in whorls.
verticilla'tus, }
ve'rus, true.
vesperti'nus, pertaining to the evening.
vesti'tus, clothed.
vexilla'rius, standard-bearing.
villo'sus, shaggy.
vimi'neus, twig-like.
vino'sus, vinous, full of wine.
viola'ceus, violet-coloured.
viol'e'scens, becoming violet.
vi'rens, green.
vi're'scens, becoming green.

viga'tus, made of twigs.
virginal'is, } pertaining to a virgin,
virgi'neus, } maiden.
vi'ridis, green.
viridi'ssimus, very green.
vi'scidus, } sticky, viscid.
visco'sus, }
vitelli'nus, yellow, like the yoke of an egg.
vitta'tus, striped with ribbons or vittæ.
vivi'parus, born alive, viviparous.
volu'bilis, twisting round.
vulga'ris, common, ordinary.
vulpi'nus, relating to a fox.

X.

xanthi'nus, } yellow. (Greek, *xanthos*.)
xantho-, }
xylo-, woody-; e.g., *xylocarpum*, woody-fruited. (Greek, *xulon*, wood.)

Y.

yuccaefo'lia, with leaves like the Yucca.

Z.

zantho-, yellow- (Greek, *xanthos*); e.g.
zanthorhiza, with yellow roots.
zonal'is, } zoned.
zonal'tus, }
zygo-, united-; e.g., *zygophyllum*, having united leaves.

LIST OF WORKS QUOTED,

WITH THE ABBREVIATIONS BY WHICH THEY ARE DESIGNATED.

*Works marked thus * are still in course of publication.*

- AIT. H. KEW.—Aiton, William. Hortus Kewensis, or a Catalogue of the Plants cultivated in the Royal Botanic Garden at Kew. 3 vols., 8vo. London, 1789. Ed. 2, by W. T. Aiton. 5 vols. 1810-1813.
- ANDR. HEATH.—Andrews, H. C. The Heathyery. 4 vols., 8vo. London, 1804-1812.
- ANDR. REP.—Andrews, H. C. The Botanist's Repository. 10 vols., 4to, 664 coloured plates. London, 1797-1811.
- B. C.—Loddiges, C. The Botanical Cabinet. 20 vols., 8vo, 2,000 coloured plates. London, 1818-1833.
- B. M.*—Curtis, C. The Botanical Magazine. 8vo. London, 1783, etc. Now edited by Sir J. D. Hooker.
- B. R.—Edwards, S. The Botanical Register. 33 vols., 8vo. London, 1815-1847. Volumes 14 to 33 were edited by Dr. Lindley.
- BATE. ORCH.—Bateman, J. Orchidaceæ of Mexico and Guatemala. 1 vol., folio. London, 1837-1843.
- BAUER IC.—Bauer, Franz. Delineations of exotick plants cultivated in the Royal Garden at Kew. Published by W. T. Aiton. 1 vol., folio, 30 coloured plates. London, 1791-1800.
- BEDD. FL. SYL.—Eddome, R. H. The Flora Sylvatica for Southern India. 2 vols., 4to. Madras, 1869-1873.
- BELG. HORT.—La Belgique Horticole. 35 vols., 8vo. Liège, 1851-1885.
- BENT. AND TR.—Bentley, Robt., and Trimen, H. Medicinal Plants. 4 vols., 8vo. London, 1875-1880.
- BERL. GART. ZEIT.—Berlin Garten-Zeitung. Monatschrift für Gärtner und Gartenfreunde. 8vo. 1892-1886.
- BRANDIS F. FLOR.—Brandis, D. The Forest Flora of North West and Central India. 1 vol., 8vo., and Atlas, 1 vol., 4to. London, 1874.
- BULL. SOC. TOSC.*—Bullettino della R. Società di Orticultura. 8vo. 1876, etc.
- ENG. BOT. ED. 3.—Boswell Syme, J. T. English Botany, or Coloured Figures of British Plants. Ed. 3, 12 vols., 8vo. London, 1863-1886.
- FL. DAN.—Floræ Danicæ. 18 vols., folio. Copenhagen, 1764-1874.
- FL. GR.—See SIBTH. FL. GR.
- FLOR. MAG.—The Floral Magazine, edited by T. Moore. 1st series, 10 vols., 8vo. London, 1861-1871. 2nd series, 10 vols., 4to. London, 1872-1881.
- FL. AND POM.—The Florist and Pomologist. 8vo. London, 1868-1884.
- FL. SER.—Flore des Serres et des Jardins de l'Europe. 8vo. Gand, 1845, etc.
- FL. TASM.—Hooker, J. D. Flora Tasmanicæ. 2 vols. 4to, 200 coloured plates. London, 1860.
- G. AND F.*—Garden and Forest. 4to. New York, 1898, etc.
- GARDEN.*—The Garden. 4to. London, 1871, etc.
- G. C.*—The Gardener's Chronicle and Agricultural Gazette. 33 vols., 4to. London, 1841-1873. The Gardener's Chronicle. Series 2, 26 vols., 4to. London, 1874-1886. Series 3. 1887, etc.
- GEN. PL.—Bentham, G., and Hooker, Sir J. D. Genera Plantarum. 3 vols., 8vo. London, 1862-1883.
- GFL.*—Gartenflora. 8vo. Zurich, 1852, etc.
- HAMB. GART.—Hamburger Garten- und Blumenzeitung. 46 vols., 8vo. Hamburg, 1845-1890.
- HARRIS. CAB.—Harrison, J. The Floricultural Cabinet and Florist's Magazine. 21 vols., 8vo. London, 1833-1853.
- HARV. THES. CAP.—Harvey, W. H. Thesaurus Capensis, or Illustrations of the South African Flora. 2 vols., 8vo. Dublin, 1859-1863.
- HOOK. BOT. MISC.—Hooker, Sir W. J. The Botanical Miscellany. 3 vols. 8vo., 112 plates. London, 1830-1833.

- HOOK. EX. FL.—Hooker, Sir W. J. The Exotic Flora. 3 vols., large 8vo, 232 coloured plates. Edinburgh, 1823-1827.
- HOOK. FIL. EXOT.—Hooker, Sir W. J. Filices Exoticæ. 1 vol., 4to, 100 coloured plates. London, 1859.
- HOOK. GARD. FERNS.—Hooker, Sir W. J. Garden Ferns. 1 vol., 8vo., 64 coloured plates. London, 1862.
- HOOK. IC. FIL.—Hooker, Sir W. J., and Greville, R. Icones Filicum. 2 vols., folio, 240 coloured plates. London, 1829-1831.
- HOOK. SP. FIL.—Hooker, Sir W. J. Species Filicum. 5 vols., 8vo. London, 1846-1864.
- HORT. VANH.—Hortus Vanhoutteanus. 1 vol., 8vo. Gand, 1845.
- IC. PL.*—Hooker, Sir W. J. Icones Plantarum. 8vo. London, 1836, etc. Now edited by Professor D. Oliver, F.R.S.
- ILL. HORT.*—L'Illustration Horticole. Series 1 to 4, 33 vols., 8vo. Gand, 1850-1886. Series 5, 4to. Gand, 1887, etc.
- JACQ. FR. JACQUIN, N. J. Fragmenta Botanica. 1 vol., folio, 138 coloured plates. Vienna, 1800-1809.
- JACQ. H. SCHOENB.—Jacquin, N. J. Plantarum rariorum horti Schoenbrunnensis descriptiones et icones. 4 vols., folio, 500 coloured plates. Vienna, 1797-1804.
- JACQ. IC.—Jacquin, N. J. Icones Plantarum Rariorum. 3 vols., folio, 648 coloured plates. Vienna, 1781-1793.
- JACQ. STAP.—Jacquin, N. J. Stapeliarum Culturarum Descriptiones, etc. 1 vol., folio. Vienna, 1806.
- JACQ. VIND.—Jacquin, N. J. Hortus Botanicus Vindobonensis. 3 vols., folio, 300 coloured plates. Vienna, 1770-1776.
- JENN. ORCH.—Jennings, Saml. Orchids, and how to Grow them in India and other Tropical Countries. 1 vol., 4to. London, 1875.
